This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

**Usage guidelines**

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

# MODERN ENGLAND

The England around us becomes our own England, an England whose chief forces are industry and science, the love of popular freedom and of law, an England which presses steadily forward to a larger social justice and equality, and which tends more and more to bring every custom and tradition, religious, intellectual, and political, to the test of pure reason.

# PREFACE

THE scope and limits of the present work are to some extent indicated by its second title. A record of opinion and action, as distinguished from a record of events, deals especially with those elements of history which are determined by mental causes, by human feelings, human reason, and human will, rather than by those unconscious agencies which the great historians of antiquity were wont to group together under the names of fortune or fate. In pursuance of this method I have omitted masses of detail which bulk very largely in the pages of most English Histories, such as the particulars of battles and sieges, incidents in the lives of great personages possessing merely biographical interest, Court pageants, and so forth. On the other hand, this economy of space has enabled me to include some intellectual events that other historians have altogether omitted, and to give a much greater relative prominence to those general tendencies by which social changes are ultimately determined. In particular, I have devoted special attention to that widespread disintegration of theological beliefs which Nietzsche has called the greatest event of modern history, bringing into view on the one side its antecedents in the philosophy, science, and scholarship of the age, and on the other side its reaction on literature and politics.

This task has involved the reproduction in a summary form of much that has already appeared in my *History of English Rationalism;* but a repeated survey of the field has enabled me to include a few details not mentioned in the larger work.

On matters not connected with the Rationalistic movement I have sometimes found myself obliged to go somewhat more into detail than the general scope of this History seemed to demand, because the ground was pre-occupied by views that in my opinion are either false or incomplete. For instance, the praise for efficiency so often bestowed on our old oligarchical government appears to me undeserved. The credit for philanthropic legislation so freely given by modern Tories to the Tory party at the expense of Whigs and Radicals is, so far as I can make out, totally unjustified. The services rendered to good government by the philosophic Radicals have been strangely overlooked, even by their special historians, M. Elie Halévy and the late Sir Leslie Stephen. I feel extreme diffidence in opposing, on his own ground, so high an authority as Professor Albert Dicey. But I cannot help thinking that in his important work on *Law and Opinion* he has enormously exaggerated the part given to individualism and *laissez-faire* in the philosophy of Bentham and his school. It seems to me that our modern socialistic legislation was in part anticipated by the old Utilitarians, in part has been directly developed out of their principles.

With regard to English foreign policy, I do not think George Canning has yet received anything like his due meed of recognition as a "hero of the nations." And

the same observation applies with even greater force to Canning's true successor, Palmerston. The serious errors that mark Palmerston's closing years have somewhat clouded his reputation. But they were errors inspired by the same noble love of justice and freedom which, together with a patriotism more antique than modern, was the moving principle of his whole political career. As a part of this policy he fought the Crimean War, which, if I am not mistaken, was no such ghastly blunder as is now commonly believed, but a necessary step in the deliverance of Europe from the old despotisms and its reconstitution on the lines of national independence. I hold that Kinglake, genuinely Liberal as in many ways he was, has obscured the true interpretation of the war waged by England and France against Russia by representing it in the light of a mere dynastic intrigue of Louis Napoleon's for obliterating the memory of the *Coup d'État*. My view is that France was drawn into the war by England, acting under Palmerston's guidance; but that England's motives were not self-interested, the object of her people being to avenge the wrongs of Hungary and to deliver Europe from the despotism that had been weighing on it for forty years. And the profound mistake of Disraeli, when he fancied himself the inheritor of Palmerston's policy, was not to see this—not to see that the English people are always on the side of freedom, and that freedom in 1876 was not represented by Turkey, but by Russia.

To all appearances, it has not been reserved for the twentieth century to discard the enthusiasms of its predecessor; and any English statesman who imagines

that the idea of freedom has been played out will sooner or later—and sooner rather than later—discover to his cost what potentialities of energy that idea still contains.

My best thanks are due to Mr. G. M. Trevelyan, who has kindly read through this work in MS., and suggested some important corrections; to my wife, who has given me invaluable assistance in revising the proof-sheets; and to the press-reader of Messrs. Watts and Co., whose criticisms have enabled me to rectify some inaccuracies of statement and style.

## Chapter I.

# ORGANISED ANARCHY

Forty years before the French Revolution began the greatest of French political philosophers, Montesquieu, declared that liberty was the organic principle of the English Constitution, the supreme end for whose attainment every part of its complicated mechanism had been devised. And there can be no doubt that, next to the republics of classical antiquity—if not, indeed, before them—England continued to be the ideal by which Montesquieu's saner countrymen were guided in their endeavour to substitute a more rational form of government for the decrepit despotism of their Bourbon kings.

This admiration, although excessive, rested on a solid basis of fact. At the opening of the revolutionary era England had for a century possessed far more political liberty than was enjoyed by any other great European State. Except among her own emancipated children, the newly-constituted United States of North America, no parallel to it could be found. It must not, of course, be forgotten that the term "political liberty" bears two independent senses. It stands for the absence of vexatious trammels on individual action. But it stands also for self-government, for the participation of the people in the passing and the administration of their laws, in the choice of their rulers, in shaping the

general policy of the State. Now, in both senses of the word England had much less liberty than she afterwards obtained; but the amount realised was still considerable. So far as the higher and middle classes were concerned, people could generally go about without let or hindrance, and, within the limits of mutual respect, could say or do what they liked; while the country was governed by public opinion to an extent elsewhere unknown. The voice of the educated classes and the wishes of the great interests—so far as they had become articulate—which divided English society among them found a tolerably efficacious expression in representative institutions which, however defective from a modern point of view, were not ill adapted to the wants of the time, in trial by jury, in public meetings, in pamphlet literature, and in the newspaper Press.

Political observers thought it much to preserve without extending what, in their opinion, had been so completely won. The spirit of English liberty during the latter part of the eighteenth century took the form of jealous opposition to all encroachments, real or supposed, on the part of what was called the power of the Crown. The tyranny of the Stuarts and, it must be added, of Cromwell had left bitter memories behind, not always manifested in the most reasonable ways.

Under the first two Georges there could be little to fear from the personal ambition of the king. Those sovereigns were entirely in the hands of the great Whig families to whom they owed their throne, and who could alone maintain them on it against the steady hostility of the country gentlemen

and the occasional ill-will of the masses, always ready to resent the intrusion of a foreigner.

Still the royal authority, though not directly in evidence, continued to exist, and made itself felt in more than one way. It was responsible, largely through the silent influence of Queen Caroline, for Sir Robert Walpole's long tenure of office, and, so far, must be reckoned as a mainly beneficent force. On the other hand, royalty has to be debited with abuses recalling the bad days of the Stuarts. The Court still set an example of profligacy and extravagance. The national wealth was squandered on unworthy favourites. The country was entangled in foreign wars with which it had no concern, through the dynastic interests of the reigning family; and incompetent princes received high military commands, with disastrous results to our arms.

With the accession of George III. the king's personal power both in principle and practice returned to vigorous life. Various causes simultaneously worked to the same effect. Bolingbroke, the ablest and most brilliant political writer of his age, had for many years been preaching the gospel of the Patriot King, of a ruler who, raised by his position above the strife of factions, should devote himself entirely to the good of the country; he had won over the intellect of England to this new form of Toryism; and his principles, so far as they made for absolutism, were highly acceptable to the circle in which the heir to the throne had been brought up. George III.'s mother, the Princess of Wales, had imported the same tradition of absolutism from Germany, and had often told her son to be a king.

Any lingering prejudices against the foreign dynasty were dispelled by the young sovereign's public declaration that, "born and bred an Englishman, he gloried in the name of Briton"—a phrase peculiarly calculated to secure the enthusiastic loyalty of his northern subjects. Jacobite gentlemen crowded to his Court, and were received with marked favour. Their new master proved an excellent substitute for the once chivalrous and fascinating Charles Edward, who by this time had degenerated into a brutal drunkard.

The new reign, in fact, amounted to a second Stuart restoration, including guarantees for Protestantism—which, by the way, Charles Edward would also have given—and it soon led to peace with France, the old ally of the Stuarts, the great War Minister, Pitt, being replaced at the head of affairs by a royal favourite, Lord Bute. Peace, though expedient, proved unpopular; and this first triumph over public opinion was followed by a prolonged conflict, in which the King suffered many humiliations. Not until ten years later did he find a Minister to his mind in Lord North. Personal government then had a free hand; but the experiment did not succeed as Bolingbroke had expected. Under the management of George III. a series of disastrous defeats led up to the permanent separation of the chief North American colonies from the mother-country, and to the temporary recognition of an independent Parliament in Dublin. A hostile vote of the House of Commons compelled the King to part with the subservient instrument of his designs, to accept Ministers whom he hated, and to sue for peace to the Powers whom

the elder Pitt had left prostrate at England's feet. As if to put the seal on his discomfiture, the new Administration passed a Bill involving a considerable reduction in the offices and pensions by which the unconstitutional influence of the Crown seemed to have been chiefly maintained.

Nevertheless, in the very year that saw the signature of an ignominious peace with France and her allies, George felt himself strong enough to dismiss a Ministry forced on him by the House of Commons, to bestow office on the younger Pitt, then only twenty-four years old, and to maintain him in that position against a series of hostile Parliamentary votes. What was more, the General Election of 1784 confirmed the King's choice by such an overwhelming majority of the constituencies that his opponents found themselves reduced to political impotence for twenty years to come.

The ostensible reasons for this momentous decision were the details of a Bill for the better government of India, tending, as was alleged, to reserve an enormous amount of patronage for the Whig leaders; and the scandal caused by an unprincipled coalition between Fox, the great Whig orator, and North, the Minister whose American policy he had long denounced in terms of unmeasured vituperation. But it was only reasonable that Indian patronage should be kept out of the hands which had dispensed English patronage with such disastrous effects; and that Fox should ally himself with North seems hardly, if at all, more immoral than that Chatham's son should make himself the instrument of one by whom Chatham's policy of conciliation had been rejected

and Chatham's imperial work undone. In truth, the popular feeling had deeper sources than any interests of the hour. It sprang from a genuine royalism, which in all obscure or doubtful issues inevitably went for the King and against those whom he was pleased to call his enemies.

Two more significant facts may be quoted in attestation of the personal authority exercised by the English monarch at the time of the French Revolution. One is furnished by the American Constitution as finally determined in 1789. The legislators who drew up that instrument evidently designed it as an adaptation of English institutions to the requirements of a new and more democratic society. Now, not only did they place a monarch, under the name of President, at the head of their Federation, but they gave that monarch, during his four years' tenure of office, powers of controlling the Executive and interfering with the Legislature such as George III. rather pretended to than actually possessed.

The other fact is connected with the celebrated Regency debates of 1788. In that year the King was overtaken by a fit of insanity, temporarily incapacitating him for the discharge of his duties, which, had it continued, would have necessitated the appointment of a Regent. The question came before Parliament, and some nice Constitutional questions were raised as to whether the Regency devolved by right of birth on the Heir Apparent or should be conferred on him by special legislation; and on the second alternative what restrictions, if any, should limit his exercise of the royal authority. From first to last the points at issue were debated

on purely party lines, and it was understood throughout that the whole interest of the conflict depended on the undoubted assumption that the Prince of Wales, when invested with his father's authority, would dismiss his father's Ministers, replacing them by the heads of the Whig Opposition. The Prince was known as a drunken and faithless libertine; but it seemed to be agreed on all hands that the majority of the House would transfer their allegiance from Pitt to Fox at his bidding; or that, in the event of a General Election, the constituencies would ratify the policy of the Regent as obediently as they had ratified the directly opposite policy of the King four years previously. In point of fact, a dissolution would have been unnecessary. For we know, on good authority, that in the House of Commons, as then constituted, the party of the Crown numbered 185, Fox's party 138, and Pitt's personal following only 52.[1]

Thus the King was far from being a Venetian Doge. With almost any character or capacity he was the most powerful individual in the country. With a first-rate intellect he would have been an all-powerful and irremovable Prime Minister. Nevertheless, both then and long afterwards the English Constitution might with some reason have been described as an oligarchy. The sovereign both possessed and exercised the right to choose his Ministers, but in practice he had to choose them from among the great governing families and their nominees, and it was by the character of these men as a class that the character of the Government was determined in the long run.

[1] Lord Rosebery's *Pitt*, p. 71.

Much has been written in praise of what is called the English aristocracy; that is, presumably, the titled possessors of hereditary territorial wealth; and sometimes even in foreign countries it is credited with the possession not only of large estates, but also of extraordinary virtues, and more particularly virtues of a political order. Yet, as compared with the hereditary governing classes of ancient Greece and Rome, or even of modern France and Germany, our nobles do not show to advantage as regards intellectual eminence. Up to the period we are now considering they had contributed no name of the first order to English literature, unless Henry St. John is to be counted as an exception. Their services to physical science and erudition do not exceed the limits of respectable amateurship. Two names, Peterborough and Howe, represent their achievements as commanders by land and sea. In the field of statesmanship, where most might have been expected, their sterility is most remarkable. The true makers of England's greatness and vigour—Thomas Cromwell, Cranmer, Burghley, Walsingham, Pym, Oliver Cromwell, Somers, Marlborough, Sir Robert Walpole, Chatham, Clive, Warren Hastings, Burke, Canning, Peel, Cobden, and Gladstone—all sprang from the gentry or the middle classes. On the other hand, our notorious incompetency in negotiating advantageous treaties of peace, although perhaps no misfortune as regards the more solid interests of the country, must be counted to the discredit of a diplomatic service which is peculiarly aristocratic in its composition.

A notion has been sedulously propagated by

modern Tory writers that the Whigs were an eminently oligarchical party, and that men of ability but without aristocratic connections were more systematically excluded from high office by them than by the Tories. But this view is hardly borne out by the facts. High social position was as largely represented in the Cabinets of Lord North and of Pitt as in the Cabinets of their predecessors, if not more largely. Edmund Burke is the standing example of Whig exclusiveness, the truth being that his violent temper would have made him impossible in any Cabinet. After the French Revolution a few outsiders of exceptional talent or ability to please were admitted to high office by the Tory party. This, however, may be explained by its being the party in power—a circumstance which would naturally attract ambitious young men into its ranks, where also the general average of stupidity would make their assistance more desirable. In the eighteenth century what really distinguished the Whigs from the Tories was not their oligarchical tendencies, but their steady opposition to the personal government of the King, to his interference with the choice of Ministers and with the conduct of affairs. For the rest, Toryism appealed more to the landed interest, Whiggism more to the commercial and industrial interests of the country. And in the conflict with America the landowners supported the king in his policy of coercion, while the business classes were for yielding to the demands of the Colonies.

At the same time, it would be a serious mistake to identify the Whigs of those times with what are

now called Liberal principles, with the idea of perpetual progress in speculation and practice, with democratic politics, or with reason as opposed to tradition; still less were the Tories in any sense a party of reaction or conservation, or in any pre-eminent sense a party of order. The Liberal party of our own day is indeed connected by an unbroken chain of development with the Revolution Whigs; while their opponents, by reviving the name of Tory, seem to claim a still more direct filiation from the Jacobites and the King's friends. But this sort of historical continuity does not necessarily involve a continuity of principles. With parties as with all other organisations, the first law of existence is self-preservation, and in obedience to it they may transform themselves almost out of recognition.

It is a familiar commonplace that to be in office tends to foster one set of opinions, while to be in opposition tends to foster the contrary opinions. Under the first Hanoverian Kings the Tories were excluded from power, and this circumstance gave them an individuality, a love of liberty, one may almost say an ideality, which their return to Court favour could not so soon destroy. Johnson, the typical Tory, loved originality, he believed in human progress, he hated West Indian slavery; if he upheld American taxation, it was on grounds of justice. Burke, the great Whig theorist, always appealed to expediency and experience; the sanctities of tradition had no more staunch upholder; his own time even seemed to him degenerate in comparison with the Middle Ages. The younger Pitt was long the idol of the Tory party, the founder

of its glory and success in modern England. But Pitt was no Conservative. The three great measures on which Liberal politicians since his time have successively staked their existence—Catholic Emancipation, Parliamentary Reform, and Free Trade—were his measures. And of these Catholic Emancipation was opposed by the Duke of Portland, Parliamentary Reform by Burke, and Free Trade by Fox; while the first and third were afterwards taken up by Pitt's disciple, Canning.

There is, however, one vital issue with respect to which the lines of party division exhibit a more unbroken continuity than with respect to any other difference of opinion. That is the question of permitting or prohibiting free criticism in politics and religion. As compared with their opponents, the Revolution Whigs had stood more or less for free speech all round; and their prolonged exercise of power had not made them entirely forgetful of the cause they originally represented. Their subsequent exile from office revived those earlier memories; and all through the French revolutionary storm a Whig remnant clung to personal freedom more ardently than ever, now that it had been recognised as not merely the privilege of Englishmen, but as the right of all mankind.

The King and the oligarchs exercised power through Parliament, and in Parliament through the House of Commons. The so-called popular Chamber did not outwardly represent the people. "One hundred and seventy-two of the English and Welsh members were returned on the direct nomination of the Treasury or of individuals. The

forty-five Scotch members were nominated by thirty-five persons. Three hundred and fifty-four members were therefore returned on the recommendation of the Treasury or of some patron."[1] But, although these 354 gentlemen were not elected by the people, it would be a mistake to suppose that they did not represent the people, or that an equal number of members elected by popular suffrage would have been better qualified to sit in the Sovereign Assembly. Merely to occupy such a position gives a sense of responsibility not necessarily associated with the exercise of demagogic arts. Even the Irish Parliament of the eighteenth century, composed as it was of nominees and managed by corruption, had that sense to some extent. Even the servile Corps Législatif of the second Napoleonic Empire successfully resisted a proposal made by its master to entail an estate on the family of one of his favourites, against the law of modern France. And when the Liberal Opposition came to muster very strong in that body they were soon joined by so many supporters of the Government as to form a working majority. The members of our unreformed Parliament no doubt sold their votes. But they would equally have sold them, without losing their seats, under any system of popular suffrage that could have been devised.

In the earlier part of the eighteenth century the Peers were in advance of the Commons, and the Commons were both then and much later in advance of average English opinion. Had the

borough members of Walpole's age represented the wishes of the urban constituencies as genuinely as the county members represented the feelings of the rural constituencies, the Stuarts would probably have been restored. A century later it is not clear that a reformed Parliament would have passed Catholic Emancipation. What enabled George III. on more than one occasion to carry out a disastrous policy was that he had a majority of the country at his back.

It seems at first sight an optimistic hallucination to maintain that a system full of anomalies, the unintentional and incalculable result of one historical accident after another, should have miraculously turned out to be the best fitted for the people which had somehow blundered into it. But really no more is meant than that the old English Constitution, such as it was, fairly represented the balance of forces then at work; and above all that it organised, in a way, that liberty for the possession and preservation of which our island was famed. And, in fact, such political thinkers as Burke and Canning, in proclaiming the supreme excellence of the Constitution, rotten boroughs and all, dwelt most on the practical experience that it worked well, securing the largest amount of liberty compatible with public order. They failed to see that it fell lamentably short of what a Government ought to be, that it provided neither for social order nor for social progress, that the boasted system of checks and balances was responsible for a paralysis which the people felt obscurely, and that the only hope of salvation lay in the development of the democratic and

freethinking elements whose explosion on the Continent filled them with such dismay.

What we find, then, professing to perform the functions of government is an oligarchy always controlled and sometimes directed by the public opinion of the upper and middle classes. Sometimes opinion embodied itself in a great statesman, sometimes in a king of average judgment and ability who mistook the will of the people for his own will. The result was a moving equilibrium of competing interests, favourable to the development of individual genius; not favourable to orderly progress, to a wise economy of the national resources. So much industry, ability, and money were spent on making the Parliamentary machine work smoothly that nothing was left for securing legislative and administrative efficiency.

A theory had been gaining ground since Locke that the duty of the State goes no further than the protection of its citizens against domestic and foreign aggression. The theory may be good or bad; but, at any rate, the duties it recognises were not fulfilled by the so-called Government of England. There was no police to speak of; the roads were infested with highwaymen, the streets with footpads and pickpockets, the seas with pirates, the avenues of credit with forgers. Groups of irritated interests appealed to their Parliamentary representatives for protection; it was given by extending the death penalty to such a multitude of trivial offences that in many cases the wronged individuals would not prosecute, or juries would not convict, or judges would not condemn, or the

executive would not carry out the sentence, with the result that depredations were multiplied by the chances of impunity; while the prisons, instead of being deterrents or preventives, were so mismanaged as to become nurseries for the propagation of crime and disease.

Foreign aggression being chiefly conceived under the form of foreign industrial competition in the shape of imported goods, it was resisted by prohibitive or protective duties, calling into existence a host of smugglers who introduced the competing products duty free. The division of military authority between the King and the Parliamentary War Minister fatally undermined the efficiency of the army, which, besides, was weak and ill-officered through the whole hierarchy of command. As it happens, fleets cannot be sailed without a relatively high degree of professional ability; and in the case of the English navy the supply, to some extent, corresponded with the demand. The country was guaranteed against invasion, in a military sense, by an Admiralty which seems to have been the best-equipped branch of the public service, and was at least better than any on the Continent. Still, at a great crisis of the national fortunes England's maritime supremacy was nearly wrecked by corruption in high places; while on that and another occasion the national security was still further hazarded by the English Government's insistence on the exercise of certain alleged rights, which the neutral powers united in arms to repel. It remains to add that, as a maritime conscription would have been repugnant to English ideas of liberty, violent

impressment of merchant sailors was used as a means for recruiting the fleet, to the general satisfaction of free-born landsmen.

Not only did the Government fail to provide adequately for public order and safety, but it allowed the machinery of justice to be perverted into a means for the spoliation of its subjects. Viewed from the standpoint of scientific jurisprudence, English civil law was a chaos; as an instrument for filling the coffers of lawyers at the expense of litigants it was contrived with consummate skill; while in applying it to that sinister purpose counsel on both sides might reckon on the cordial co-operation of the judge, for he regarded them as the parties whose interest he sat on the bench to protect.

A secular power that failed to perform the primary duties of government found its appropriate pendant in a spiritual power that could neither edify nor instruct. Through the eighteenth century the Church of England had no other object than to preserve what she had won in the seventeenth century—that is to say, a monopoly of those endowments and privileges, which for the higher clergy meant a position of opulent and dignified idleness, and for the lower clergy a position of indigent and despicable idleness. As a body these men supported every reactionary measure, initiating no reform themselves, and opposing the reforms initiated by others. The great movement for the evangelisation of the people known as Methodism was carried out without their authority and against their wishes.

The universities whose wealth they monopolised were seats neither of learning, nor of research, nor of liberal culture. Controversial writings directed against rationalism were the most imposing clerical performances of the age; but of the two strongest apologists, one, Bishop Butler, had been bred a Dissenter, and the other, Archdeacon Paley, borrowed his arguments from a Dissenting divine, Dr. Lardner.

At the beginning of this chapter it was remarked that political liberty consists in two things—in the subjection of the Government to public opinion exercised through legal channels, and in the unhindered play of individual activity within the limits of mutual respect. Now the development of English individuality was great precisely because the governing powers were so feebly organised. It was this that, in the absence of any steady or coherent system of training and policy, gave England such original statesmen as Chatham, Clive, and Warren Hastings; such party leaders as Bolingbroke, Burke, and Fox; such generals as Marlborough, Peterborough, Clive, Coote, and Wolfe; such religious apostles as Law, Wesley, and Whitefield; such reformers as Bentham and Howard; such a historian as Gibbon; such philosophers as Berkeley, Hume, and Burke; such novelists as Richardson and Fielding; such a humorist as Sterne; such a critic of life as Johnson; such mechanical inventors as Brindley, Hargreaves, Arkwright, and Watt; such explorers as Cook, Bruce, and Mungo Park. On the Continent, also, the eighteenth century was a period of great

individual initiative; but, for one thing, in no Continental country did it attain such a diversified development as here; and, for another thing, there also it owed much to political and social disorganisation, although of a different kind—the sub-division of Italy and Germany among many rulers, the growing contempt for all rule in France, the continual migration of eminent men from one country to another.

This last factor told also for much in the evolution of British genius and thought. Among English men of letters, Swift, Berkeley, Farquhar, Burke, Goldsmith, and Malone were born and educated in Ireland; Steele, Sterne, Francis, and Sheridan were of Irish birth and English education. Toland, the founder of English Deism, was an Irishman of Scotch education; Hutcheson, the founder of Scotch philosophy, was born in Ulster; Hume spent his most studious years in France; and if Adam Smith's six years' residence at Oxford not unnaturally prejudiced him against endowments, it saved him from Hume's prejudice against England; Gibbon first found his true self at Lausanne; Bentham was first revealed to his own countrymen through the French translations of Dumont, a Genevese refugee; Smollett, the first novelist of the English navy, and Boswell, the devoted biographer of England's most characteristic worthy, were Scotchmen born and bred.

This expansion of the English intellect was not directed towards high or ideal ends. Discounting Scotland—whose achievements, belonging as they do to a distinct social organisation, should be

separately estimated—England in the eighteenth century shows conspicuous literary poverty as compared with what the preceding and following ages produced; while in science and philosophy, after the exhaustion of Newton's generation, there came a period of total sterility, followed by a period of gradual recovery due to foreign influences. When the revival comes, it is carried on by the labours of two distinguished amateurs, Cavendish and Priestley, neither of them occupying an official position, and of Sir William Herschel, who was not only an amateur but a foreigner. The last alone formed great and comprehensive views on the constitution of nature. Not until some years after the French Revolution did English men of science rise to the construction of truly philosophical explanations of phenomena.

When we compare this sterility of the higher English intellect with the contemporary achievements of Scotland, considered not merely in reference to the much smaller wealth and population of the northern kingdom, but absolutely, weight for weight; or, again, when we think of what was being done at the same time in France, formerly so far behind England—we cannot but seek for a general cause of the disparity in some difference of social conditions.

The decline of English science has been explained by a continued survival of theological bigotry, with which a further development would have brought it into direct collision. But theological prejudices were then more potent in Scotland and France than among ourselves; nor does there seem any reason why religious beliefs should be more

alarmed by further progress in the higher mathematics, or in physics, chemistry, and natural history, than they had been by the researches of Newton, Boyle, and Ray. Geology was destined to prove a more irreconcilable study; but the speculations of Buffon and Hutton on the subject do not seem to have been hampered by clerical opposition. Moreover, the great religious revival of the eighteenth century, so far from being associated with a further decline of English science, coincided, step by step, with its resuscitation.

We must look for the real cause among more material agencies. Ideal pursuits in general declined because the English intellect was diverted towards the creation and enjoyment of wealth. It was an era of vast territorial expansion, avowedly sought after with a view to the extension of commerce; of great mechanical inventions chiefly intended to facilitate manufacturing industry, of sweeping enclosures made in order to bring fresh soil under cultivation, of corresponding improvements in the means of communication and transport. In reference to this movement, it was no misfortune, but the contrary, that government should be so torpid, that individual initiative should have the freest play where it was most needed, that protectionist legislation should not be aggravated by misguided attempts to supervise the mechanism of industry. Even clerical inertness told as a negative condition of conquest. Clive and Hastings could never have accomplished their great work had a swarm of missionaries been sent out to rouse Oriental fanaticism against the rule of the Feringhees.

It had been believed in the seventeenth century that the new physical sciences imported from Italy and Germany would lead to an immediate and enormous increase of material wealth as well as to new triumphs over death and disease. Except for being premature, the expectation was right, but right only by accident. What Bacon really anticipated has never been accomplished; nor did Newton succeed in the great object of his studies, which was the transmutation of baser metals into gold. With the failure of such hopes English statesmen withdrew their interest from the investigations of the Royal Society. Probably their opinions in the matter are pretty faithfully reflected in Swift's account of the philosophers of Laputa, written, be it remembered, by one who had human well-being passionately at heart, and grudged every intellectual exercise not given to its promotion. But science had now reached a point where it could not be carried further without disinterested love of knowledge on the part of its professors, upheld by a like feeling on the side of the public, nor without considerable endowments from public or private sources. This truth is singularly illustrated by the lives of the only three savants that England for a long period had to show. Cavendish possessed enormous private means; Priestley was first the librarian and afterwards the pensioner of Lord Shelburne; Herschel owed the leisure needed for his observations to the munificence of George III. Maladministration of the public funds left nothing over for the promotion of liberal studies; and the universities, which should have been homes of research, had allowed their professorships to lapse

into sinecures for the additional sustenance of hard-drinking idle Fellows. To draw in as much wealth as possible in the shape of students' fees, and to give as little in exchange for it as possible, was the object of the ruling powers at Oxford and Cambridge. All pass-examinations were made easy, and young lords got their degrees without being examined at all. Scotland and Ireland, being much poorer countries, felt the need of qualifying men to work for their living, and therefore a much more efficient education was given in their universities.

The decline of literature presents a more difficult problem, and any explanations that are offered here must be taken merely as suggestions towards a possible solution. There was, first of all, as with philosophy, science, and scholarship, the diversion of creative genius into the more lucrative channels of politics, business, and mechanical industry, or, failing these, of parasitism on the holders of wealth and power with little taste for the disinterested activities of the spirit. There was, in the next instance, amid the general decline of authority, a most unhappy erection of authority where it was least to be desired—in the field of poetry. This invasion was due to the influence of France, which had set in with the Restoration. The facility and charm of French literature would in any case have made it attractive, and at this period its attractiveness was enormously enhanced by the absence of any rival except the classic literatures of Greece and Rome, which, so far from counteracting it, contributed to the same effect. For the French themselves were

enslaved to the classic tradition of Rome—that is, to the conventions of a literary school artificially brought into existence by the lessons of Greek rhetoricians and of Greek philosophy in its old age. Hence, poetry as expression was tied down to such monotonous metres as lent themselves most readily to the dictation of pedants; while poetry as ideas was made an instrument of instruction, indirectly as a satire on social vices, or directly as a series of elegant platitudes. And this petty didacticism overflowed, to its great detriment, into the realm of prose fiction, where the highest literary originality of the century had sought out a last refuge and defence.

One idea of Greek philosophy proved a saving element in this desert of pedantry and convention —the idea of Nature. It had been the master-thought of Stoicism; and on the downfall of Aristotelian Scholasticism the Stoics once more came to the front as leaders of European thought. Their "natural religion" became the fashionable form of theology, their appeal to nature the watch-word of morality, their dogma of natural rights, and more particularly the right to liberty, the rallying-cry of politics. In taste it took the form —at first not very sincere, but gradually growing more serious—of a preference for rural solitudes to crowded streets, bringing in the idyll as a competitor with the satire, the elegy, and the moral apologue in poetry; in painting, the landscape as a competitor with the portrait; in gardening, the wilderness as at least an adjunct to the trim parterre.

This worship of Nature led to an increased

interest in the common people—who were supposed to be in closer touch with her than the rich—and in uncivilised races; to the study of primitive literatures, chiefly as represented by ballad poetry; and to a re-interpretation of Homer, Shakespeare, and the Hebrew Scriptures as expressions of natural feeling. In this way also the Middle Ages came to attract increased attention, under the impression that simplicity and individuality flourished to a greater extent at that period than in more civilised times. But Romanticism, to call it by its later name, was not then the reactionary movement that it afterwards became when the consequences of the French Revolution threw men back on ideals dissociated from the application of reason to politics and religion. Nor did the mediævalising or Romantic movement at first place itself in conscious opposition to the study of Greek and Roman literature, however much its votaries may have revolted from the spurious classicism of their age. The two enthusiasms harmonised perfectly, the only innovation being a tendency to concentrate attention on the older and greater masters to the exclusion of their later imitators.

The great wave of enthusiasm that flooded English thought and feeling in the late thirties of the eighteenth century, bringing about the fall of Sir Robert Walpole and the rise of the elder Pitt, seems to have flowed partly from the combination of classical with romantic studies, so prominent also a little later in the poetry of Collins and of Gray. And parallel with this somewhat pagan movement we find the great Methodist

revival, less disconnected with it than might seem. For both involved an appeal to popular passion, a return to those primordial sources of inspiration whence the supreme political and religious leaders of other ages have derived their power.

The movement against convention in literature struggled fitfully for half a century before it could make any headway. The emotional and popular movement in religion was more successful. Outside the Church large masses were won over to Methodism. Inside the Church and the Nonconformist bodies, under the name of Evangelicalism, it commanded an ever-increasing number of adherents, and finally became associated with the agitation for the suppression of the slave trade—an agitation, however, first begun and then mainly carried on by the Quakers. The religious revival may also have had something to do with the efforts for prison reform made by Howard, himself a deeply religious character; but it is among the Unitarians rather than the Evangelicals that his chief coadjutors are to be found.

It was natural that English idealism, whatever its inspiration, should concentrate its opposition to English mammonism on the most criminal and scandalous iniquity that had been fostered by our unscrupulous greed. This was the African slave trade. As an important branch of British industry the traffic in human beings dates from the Peace of Utrecht (1713). By a special arrangement between the Crowns of England and Spain, it was then provided that English merchants should have the privilege of importing any number of negroes up

to 4,800 annually for thirty years into the Spanish-American colonies at a fixed duty per head, the profits being equally divided between the Kings of England and Spain. Under cover of this arrangement English goods were smuggled into Spanish territory to such an extent as to provoke a war between the two countries in 1739, when the allotted term had not yet expired. To make up for this deficiency it was provided by the Treaty of Aix la Chapelle that the trade should be resumed for four years more. After that we hear no more about the privilege of supplying slaves as the subject of an express stipulation with Spain. But meanwhile England's own North American colonies had come to provide a far more important market for human flesh, raising the export from Africa to an annual average of 20,000, and in a year of exceptional activity to 50,000.[1] The period following the American War of Independence showed a still further development, the annual average from 1783 to 1793 amounting to 74,000.[2] Of the number torn from their African homes, one in eight died on board ship; if it was desirable in the interests of the owners to lighten the cargo, they could legally be flung overboard like cattle.[3] Of those who reached the West Indies seventeen per cent. "died in about nine weeks, and not more than fifty per cent. lived to become effective labourers in our islands."[4] At the same time the

continuous demand for slaves fomented savage wars between the tribes of the African Continent, reducing its inhabitants to a state of barbarism whence they have not yet recovered.

To our people at home the trade that caused such horrors was a subject of unmixed congratulation. It encouraged English shipping, bringing into the port of Liverpool alone a profit of nearly £300,000 a year.[1] "It took off a considerable amount of English manufactures"; and it conferred a still more considerable indirect benefit on our industry by discouraging the growth of manufactures in the colonies, the effect of slave labour being to confine their industry to planting, with the happy result also of preventing English mechanics from emigrating to North America.[2] Accordingly, when the colonies imposed a heavy duty on the importation of negroes, whose increasing numbers were inspiring them with just alarm, "the law was rescinded by the Crown."[3]

To discourage by such indirect measures the growth of manufacturing industry in America was not enough for the governing classes in England; when certain manufactures came into existence they were forcibly suppressed. The colonies were, indeed, permitted to manufacture pig and bar iron, for in so doing they helped to supply the home industry with the raw material at a cheaper rate; but it was provided that "no mill or other engine for rolling iron, or furnace for making steel, should be permitted."[4] "The manufacture of hats was a flourishing trade, but it was rigorously put

down,"[1] and the exportation of woollen goods from one colony to another was also prohibited.[2] Their sea-borne trade, "so far as the most important articles were concerned, was limited to the British dominions."[3] In Ireland the woollen and glass industries were effectually strangled by trade prohibitions imposed for the benefit of English manufacturers.

Neither in Ireland nor in America was this abuse of power due solely to the covetousness of private interests. It partly arose from the divided and disorganised state of the central Government. The English Parliament did not wish Ireland to prosper lest the Crown, by raising a large revenue from that kingdom, might become independent of their support. And neither Crown nor Parliament wished America to be self-supporting lest she should be enabled to break off her connection with the mother country. As a result of this mismanagement the colonies were lost, while Ireland was preserved only to become a source of future difficulty and danger.

Nowhere was the mingled weakness and strength of England so signally displayed as in her dealings with India. We owe the conquest and retention of that magnificent dependency to the free and enterprising spirit, so characteristic of the English genius, displayed by the servants of the East India Company. But India once won was nearly ruined, first by the unchecked greed of a horde of hungry adventurers suddenly let loose on her inhabitants,

then by the administrative chaos resulting from the transfer of party conflicts from London to Calcutta, by the imposition of English law and an English judicature on a people of wholly alien traditions, and a Government jealous of any competing authority, by a new system of landed ownership which converted Hindoo tax-farmers into the likeness of English country gentlemen. Practical unreason reached its climax in the impeachment of Warren Hastings. Hastings was a wise and beneficent ruler, sweet-natured in private life, and popular with the Hindoos. Yet Burke, the great denouncer of Jacobinism, under the stress of party politics anticipated the rant of Jacobin orators in their attacks on the tyrant Capet by reviling him as the common enemy of the human race.

Yet, mistaken as were the Whigs in singling out the greatest benefactor of the Empire for the object of their attack, the attack itself probably led to the better government of India. It certainly excited popular interest in the subject, and was inconsistent with the system of leaving things to take care of themselves.

The policy of letting things alone suffered a remarkable exception in the one case where it might with advantage have been followed; and the genius of the century found its happiest exercise in making war on commercial restrictions. Adam Smith showed in the *Wealth of Nations* that capital and labour were most profitably employed in the ways spontaneously chosen by the self-interest of the parties principally concerned in their application to the production of commodities. By

the simple action of economic causes every individual would be told off to do the work for which he was best fitted by nature; and similarly the inhabitants of every country would take to growing or manufacturing what it was best qualified by circumstances to yield; and an unfettered system of exchange would enable them to supply each other's wants in exact proportion to their respective demands.

Smith's economic theory fell in admirably with the traditions of English liberty as they had been organised by Locke, and justified, on unexpected grounds, the principle that government should be limited to the maintenance of national integrity, public order, and private faith. Where the theory failed was principally in accounting for Adam Smith himself. His book advocates the complete surrender of the higher education to private enterprise—which, according to him, has succeeded admirably in teaching women just what they ought to know—and yet, as a great thinker and teacher, he was essentially a product of the Scotch University system, still further developed by long residence at Oxford, and perfected by the tenure of a professor's chair at Glasgow; while Pitt, one of the first statesmen to put Smith's principles into practice, had been prepared for his great office by long years of studious seclusion at Cambridge.

As regards the education of the people, however, Adam Smith held other views. He considered that it ought not to be left to private enterprise, but that as a matter of public interest it should receive public assistance and direction. In Scotland the want was supplied by an excellent system of

parochial teaching; in England popular education took on a degrading character; and, although the charity schools begun under Queen Anne continued to multiply through the century, a name carrying with it such sordid and repulsive associations was little likely to attract the children of self-respecting parents. Elsewhere Protestantism had at least the good effect of diminishing illiteracy. In this country the division of authority among a number of rival religious bodies, while favourable to religious liberty, proved unfavourable to elementary instruction; indirectly because it weakened the Government, and directly because it fomented jealousies which prevented the different sects from agreeing on a common scheme. And a further obstacle was found in the plutocratic spirit, which deliberately opposed the education of the working classes on the plea that it would unfit them for the performance of manual labour. At a later period the governing classes feared that, if the newspapers were widely read, their own tenure of power would be less secure; while the clergy held, not without reason, that the diffusion of knowledge would be fatal to their Establishment.

As compared, however, with the institutions directly created by law for the benefit of the poor, the charity schools deserve nothing but praise. The system of parochial relief established under Elizabeth had become, from being left to itself, a most calamitous institution. It meant oppression and enslavement to the labourers, civil war under the form of costly litigation to adjoining parishes. For each parish, being chargeable with the maintenance of its poor, tried to shuffle the burden on

to its neighbours, with the result that the actions at law regarding settlements and removals previous to the reform of 1834 seldom cost less than from £300,000 to £350,000 a year.[1] A poor man was not allowed to migrate from the parish to which he belonged without a certificate from the parochial authorities, who could give or withhold it as they pleased. He could be forcibly removed from a parish where he had not obtained a settlement, even without becoming chargeable on the rates; nor could he marry without leave from the authorities. To prevent the growth of a pauper population cottages were pulled down and new ones were not allowed to be built. The aim of the overseer "was to depopulate his parish; to prevent the poor from obtaining a settlement; to make the workhouse a terror by placing it under the management of a bully; and by all kinds of chicanery to keep down the rates at whatever cost to the comfort and morality of the poor."[2]

The parochial system bred a regular slave trade. When the manufacturers wanted labour they got it from the workhouses in the shape of pauper children submitted to their inspection by the overseers, picked out to suit their requirements, and handed over to them "nominally as apprentices, but really as mere slaves, who got no wages, and whom it was not worth while even to feed or clothe properly, because they were so cheap, and their places could be easily supplied. It was often arranged by the parish authorities, in order to get

All other victims of oppression throughout the Empire who could not help themselves found defenders or advocates in Parliament or in the Press. Voices were raised to plead the cause of the despoiled Hindoo, of the kidnapped African, of the outlawed Catholic, of the Colonial rebel; nor were they raised in vain. But for these little ones, for England's own orphan children, no justice or mercy was ever asked, no plea ever heard, no account ever taken, except indeed as an asset in the national wealth, to increase which they were tortured to death. In their brief passage from the squalid cradle to the nameless grave, without play-time, without Sunday,[2] as much as possible without sleep, they knew neither love nor light nor joy, nor any hope, except, perhaps, hope for the final and everlasting rest, of which they could not be deprived.

The economic principle of *laissez-faire* must not be made responsible for these abuses, nor yet the theory of natural law as opposed to artificial regulation; for nothing can be a greater infringement on individual liberty than making children work without wages, and nothing more unnatural than making them work for eighteen hours a day. Here and everywhere the root of the evil was that the State should abdicate those functions of supervision and control in whose absence delegated authorities are sure to degenerate into instruments of rapacious tyranny.

to its neighbours, with the result that the actions at law regarding settlements and removals previous to the reform of 1834 seldom cost less than from £300,000 to £350,000 a year.[1] A poor man was not allowed to migrate from the parish to which he belonged without a certificate from the parochial authorities, who could give or withhold it as they pleased. He could be forcibly removed from a parish where he had not obtained a settlement, even without becoming chargeable on the rates; nor could he marry without leave from the authorities. To prevent the growth of a pauper population cottages were pulled down and new ones were not allowed to be built. The aim of the overseer "was to depopulate his parish; to prevent the poor from obtaining a settlement; to make the workhouse a terror by placing it under the management of a bully; and by all kinds of chicanery to keep down the rates at whatever cost to the comfort and morality of the poor."[2]

## CHAPTER II.

## THE GODS ARRIVE

THE first effect of the French Revolution on English society, when its full significance became appreciated, was to give all existing tendencies a more excited self-consciousness, a clearer appreciation of their true principles and ultimate goals. There had been for some time past a number of Englishmen who combined democratic politics with a philosophic theory of human progress and free-thinking views about religion. A few of them were opposed to the perpetuity of the marriage-bond. What was happening in Paris seemed to open out a more immediate prospect for the realisation of their ideals than could have been hoped before. From that moment English Radicalism, as a more or less definite creed and party, came into existence, and has continued active ever since. Their sympathy with the French people gave the Radicals a rallying-point and a sign for mutual recognition; but it would be a mistake to suppose that they drew any peculiar inspiration from the ideas of Voltaire, of Rousseau, or of the Encyclopédists. Mary Wollstonecraft has been called a disciple of Rousseau, but in advocating the higher education and political enfranchisement of women she directly contravenes the teaching of his *Émile*. In theory the French Jacobinism founded on

Rousseau's *Contrat Social* stood for absolute government exercised by the numerical majority of the adult male population; in practice it stood for absolute government exercised by a small ring falsely claiming to represent the people. Godwin's *Political Justice,* on the other hand, is in some ways a gospel of anarchy without the constable; it altogether condemns coercion, and proposes that the business of society should be carried on entirely by reasoning, just as in William Morris's *News from Nowhere.* In practice Godwin objected even to the party system in politics as an irrational surrender of one's own individual judgment to the control of others. Here we have the old spirit of English liberty asserting itself under an extreme form without a parallel in France, but preceded in Germany by a similar manifesto from the pen of Wilhelm von Humboldt.

A more opportune and practical result of the Revolution was a revival of the agitation for Parliamentary Reform. Chatham, to whom popular support meant everything, had long since proposed to place the representation of the people on a broader basis; and the younger Pitt had three times attempted to carry out his father's ideas, on the last occasion as Prime Minister at the head of a powerful following. But neither the King nor the majority of the House would support him; and the country seems to have been either indifferent or inert. His scheme involved no more than a redistribution of seats without any extension of the franchise. The Duke of Richmond had gone very much further, proposing universal suffrage, equal electoral districts, and annual Parliaments; and

the same extreme position was adopted on the ground of natural right by the democratic societies founded after the French Revolution.

Burke had argued passionately against Pitt's very moderate Reform Bill; the more advanced democratic theories almost threw him into hysterics. Dr. Price had compared the revolt of the French people against despotism with the expulsion of James II. from England a hundred years before. Not content with pointing out the very important points of contrast between the modes of action respectively adopted by the two nations on those occasions, Burke proceeded to lay down principles of political philosophy which would make all progress impossible, and certainly would not justify the methods by which the relation of the Church to the State and of the King to Parliament were finally reconstituted in England. While very properly repudiating theories of abstract right and replacing them by an appeal to expediency as the supreme arbiter in practical issues, he fails to see that there are times—and the time when he wrote was one of them—when revolutionary methods are alone expedient: because alone possible, as a means of deliverance from intolerable suffering. And he also fails to see that the appeal to natural rights, however fallacious in its absolute extension to all times and places, had at that particular crisis, nor at that alone, a relative justification on the narrowest grounds of expediency, as the only rallying-cry by which multitudes of famishing human beings could be brought together to act as one man.

The truth is that Burke looked on any attempt

to remodel the existing state of things as something very like an impious interference with the divinely appointed order of nature. Politically he had always been a Conservative. In standing up for the Whig families and their system of party government against the personal rule of George III., in resisting the imposition of imperial taxation on America, in upholding the immunities of the native Hindoo princes against Warren Hastings, his motive had been respect for established usage. And now this reverence for ancient prescription had gained strength by being brought into relation with his equally steadfast religious convictions. The appeal to natural right in France had been preceded by an appeal to the religion of nature against revelation, latterly passing into an appeal to natural science against supernatural theology in every form; nor did it justify the Freethinkers in Burke's eyes that their attacks had been primarily directed against the Roman Catholic Church, for it had been the Church of his mother. The secularisation of Church property by the National Assembly had, in his opinion, been one of their worst crimes. To find the Revolution assuming a more and more anti-clerical aspect must have more and more confirmed his identification of democracy with atheism; and the sympathy of the leading English Unitarians with France would illustrate the sinister tendencies of any departure from the traditional orthodoxy.

If the revolutionists, with their doctrine of abstract rights, were in what Auguste Comte calls the metaphysical stage of social science, Burke is still less advanced; he remains in the theological

stage. The nearest approach to political Positivism had been made by Bentham with his doctrine of utility.

It may be said that prediction is the test of truth, and that Burke's principles were verified by the fact of their having enabled him to foretell the future course of the Revolution. But to anticipate the coming Terror and the final subjection of France to a military despot needed no extraordinary sagacity. The known character of the French people, read in conjunction with the lessons of Thucydides and Plutarch and the omens of 1789, were enough to suggest the most dismal prophecies of democratic excess; while Cromwell's career was there as a warning to all men of what a violent revolution must necessarily bring about. And, in fact, before the *Reflections* appeared Lafayette, of all men, had been pointed to as the coming dictator.

To say that the fated enslavement of France when it came would be exceptionally rigorous, because every barrier to tyranny had been levelled by the National Assembly, was no doubt an acute observation. But in Burke's mouth it has only the merit of a new application. For Montesquieu had already said of the English that, if they once lost their liberty, no people on earth would be so enslaved, for want of those great ecclesiastical and legal corporations which in other countries were interposed between the sovereign and his subjects. In point of fact, the remark was quite untrue of England, and very imperfectly true of France. Napoleon only maintained his tyranny at the cost of continual wars; and the same administrative

machinery in the hands of his successor proved quite insufficient to keep the spirit of liberty permanently under.

Where Burke was original, where he trusted to the guidance of his peculiar political philosophy, events proved him utterly wrong. So far from ruining France, the Revolution raised her within a few years to an unprecedented height of military power; within a generation her population had grown twenty-five per cent., with a more than proportionate augmentation of wealth—a rate of increase never known before; within two generations it inspired a literature and a philosophy richer and more splendid than that of her Augustan age. All who have read the *Reflections* will recognise how much the contrary of what Burke expected these results have been.

There is, however, a sense in which this great man may more truly be called a prophet, and truly transcended his age. He created Conservative philosophy—in other words, he constructed the theoretical barriers that have ever since been used to shut out political reforms of every kind. No other thinker has so well exhibited the subtlety, complexity, and obscurity of the forces by which societies are bound together, or the incalculable consequences to be expected from their paralysis; no one else has made more of the traditions by which the present is interwoven with and grows out of the past.

Burke also led the way in basing his hostility to democracy on the danger to property of a wide suffrage, and the necessity of property to the stability of society. But both he and his followers

erred by an imperfect appreciation of what they saw. The forces of social cohesion are too strong to lie at the mercy of revolutionists, as France soon proved by recovering her unity and balance far more quickly than after the troubles of the sixteenth century, when religion reigned supreme. The security of private property, too, has proved much greater and much more independent of political organisation than Burke imagined. The propertied classes have shown a singular knack of coming to the top after every revolution and under every form of government; while the wide diffusion of landed property among the community, where it has been effected, seems to make for rather than against the conservative spirit.

Another achievement of Burke's was to capture the Romantic movement for Conservatism, to associate the maintenance of existing institutions with a distrust of modern civilisation, a reactionary enthusiasm for the ideals of mediæval chivalry. There had till then been no such association. Walpole, a leader in the Romantic movement, was a Whig; and its great enemy, Johnson, a Tory of modern tastes. The Revolution, as a revolt against mediæval institutions, tended to unite all mediæval sympathies in an alliance against it.

Among the replies to Burke, Mackintosh's *Vindiciæ Gallicæ* won great celebrity for its author at the time, but is now never read, and only remembered as an instance of his political instability, for in a few years he became a convert to Burke's philosophy, and before the end of the

century was attacking with extreme violence in his public lectures what he conceived to be the principles of the Revolution. Mackintosh was pre-eminently a historical scholar, and his favourite studies had supplied him with two guiding ideas. One was the essential mutability of all human institutions; the other was the relative adaptation of all institutions to the circumstances in which they have originated. It will be observed that this is merely a more specific way of saying that institutions are evolved in response to the conditions of their environment; and, in fact, we owe to this writer the famous aphorism that constitutions are not made, but grow. It is said to have done the cause of Continental liberty incalculable harm, and certainly, if taken literally, would have destroyed it. The analogy between institutions and organisms does not really go very far; and, where they differ, institutions are immeasurably the more adaptable of the two. The reason is very simple: societies of human beings are capable of re-arranging their structures in conscious accordance with the lessons of experience, and especially they have a power of conscious imitation which plants and animals have not. Representative government and trial by jury may or may not be good things, but, at any rate, they are easy things to copy, and actually have been copied by nations from whose traditions they were widely removed—sometimes receiving improvements from the imitator which might be advantageously adopted by the original model. All imitations, to be successful, imply, of course, a certain degree of civilisation on the part of those who adopt them; and it may be truly said of certain

communities that they are not fit for self-government as we understand it; but it might be said of others with equal truth that they are not fit for steam engines, which nevertheless it would be absurd to count among the things that are not made, but grow.

Mackintosh preserves so much of his early Liberalism as to make liberty the object of all government.[1] But then he defines liberty as security against wrong. In this way he keeps up the metaphysical illusion of his opponents under a more confused form. They made liberty a right; he turns rights into modes of liberty. Oddly enough, with his historical view of government pushed, as we have seen, to the extreme of evolutionary conservatism, he combines the genuinely metaphysical notion that there are no discoveries in morality, instancing in support of his position the Pentateuchal legislation, which accepts slavery, polygamy, and blood revenge as things of course. What he wanted was probably to form a coalition of moralists in all ages against the excesses of the Revolution.

Notwithstanding its inauspicious title, Thomas Paine, in his pamphlet on *The Rights of Man,* is sometimes more modern-minded than either Burke or Mackintosh. The first part of that work is chiefly occupied with a historical vindication of the French people, and does not concern us here. The second part is an argument for abolishing the English monarchy and putting a republic in its

[1] *Miscellaneous Works,* vol. i., p. 372.

place—an utterly impracticable proposal, and more likely at that time to hamper than to help the cause of reform. Paine had done much by his other great pamphlet, *Common Sense,* to persuade the American colonists to organise themselves as an independent republic; and on the occasion of Louis XVI.'s flight to Varennes he had vainly urged the French people to follow their example. The good effect of taking his advice in the one case, and the bad effect of not taking it in the other, may have inspired him with too much confidence in his favourite panacea. After all, Burke and Pitt were still more fatally blind to political realities when they tried to destroy the new French Government by force of arms.

Apart from cheap criticism, the interesting thing is to note what was Paine's idea of government, irrespective of its form. "It is," he tells us, "nothing more than a national association; and the object of this association is the good of all, as well individually as collectively. Every man wishes to pursue his occupation and to enjoy the fruits of his labour and the produce of his property in peace and safety, and with the least possible expense. When these things are accomplished all the objects for which governments ought to be established are answered."[1] The phrase "fruits of labour" is open to conflicting interpretations, and is understood by some who have adopted it in the sense of a collectivist organisation of industry. But this is very unlikely to have entered Paine's thoughts; so far we may class him as an individualist like

[1] *Rights of Man,* Part II., p. 60 (first ed.).

Mackintosh. Nevertheless, his criticisms on the actual Government of England, and still more his suggestions for its reform, imply a strong leaning to what would now be called socialism. It is, he complains, "so absorbed by foreign affairs and the means of raising taxes that it seems to exist for no other purpose. Domestic concerns are neglected; and with respect to regular law there is scarcely such a thing."[1] "When we see old age going to the workhouse and youth to the gallows, something must be wrong in the system of government."[2] "Civil government does not consist in executions, but in making that provision for the instruction of youth and the support of age as *(sic)* to exclude, as much as possible, profligacy from the one, and despair from the other."[3]

Accordingly he proceeds to offer a scheme for old-age pensions, and another for universal elementary instruction; the cost to be provided by an enormous reduction in the present establishment, and by a progressive income-tax on landed property, amounting, in the case of large estates, to something like fifty per cent. The needs of elementary education are to be met by a truly English system of subsidies; that is, by a grant of so much per child, with orders to the parish officials to see that it is sent to school. On the other hand, no provision is made for schools or teachers. A few old people in every village will readily come forward to meet the new demand, and will be perfectly qualified for the office.[4]

Paine was prosecuted for high treason, and in all

probability only escaped death by a timely retreat to France. He was tried in his absence by a special jury, found guilty, and outlawed. But by the end of the following year (1793) 200,000 copies of the *Rights of Man* had been sold; and the number would probably have been much greater had not the sale been made penal.

With the execution of Louis XVI. a royalist reign of terror began in England, having for its object to suppress the utterance of liberal opinions in print or even by word of mouth. John Frost, an attorney, exclaimed in a public room: "I am for equality and no King!" He was tried, found guilty, sentenced to six months' imprisonment in Newgate, to stand for one hour in the pillory at Charing Cross, and to find security for his good behaviour for five years; his name was also struck off the roll of attorneys. The part of the sentence relating to the pillory was not executed—according to Frost himself, from fear of the populace. "William Winterbotham, a Dissenting minister at Plymouth," was alleged to have "preached two sermons in which he instructed his auditory that the laws were not equal, the application of public money corrupt and vicious; that the people of this country had as much right as those of France to stand up for their liberty; that the King had no title to the throne any more than the Stuarts had, and that it was time for the people to come forward in defence of their rights." Several persons swore that they were present and heard no such words; nevertheless, the preacher was found guilty, and sentenced to be fined £200 and to be imprisoned for four

years.[1] This was in 1793. In the following year Horne Tooke and several other persons were prosecuted for high treason, substantially on the ground that they belonged to a society for obtaining Parliamentary reform; but juries could not be got to find them guilty.

Other methods of coercion were then adopted, placing the right of public meeting, and even the right to open reading-rooms and circulating libraries, under magisterial control; while the suspension of the Habeas Corpus Act from 1794 to 1800 enabled the Government to imprison its critics for any length of time without a trial, and to treat them, "when in confinement, with shameful severity."[2] "The stamp and advertisement duties were increased; more stringent provisions made against unstamped publications; and securities taken for ensuring the responsibility of printers."[3] "Printers and booksellers all over the country were hunted out for prosecution."[4] In order to procure evidence against the reformers, "society was everywhere infested with espionage";[5] a watch being set even on the metaphysical conversations of Coleridge and Wordsworth.

In Scotland the policy of repression was exercised with much greater severity, four persons being sentenced to fourteen years', and a fifth to seven years', transportation, because they had agitated for Parliamentary reform. Pitt gave it as his opinion that the judges would have been highly culpable

had they shown more lenity to the prisoners, and the House of Commons approved of their conduct by an enormous majority.

At this time the men who ruled England seem to have become animated by an actual love of slavery as such. This is no metaphor, no exaggeration. Begun in 1787, the movement for abolishing the slave-trade had gained the approval of George III.; the question was brought before Parliament at the suggestion of Pitt, who powerfully supported abolition, and resolutions in its favour were passed by a unanimous vote in 1789. But in the spring of 1791 it was rejected in the House of Commons by a majority of two to one, and by the end of the year "the King had become strongly opposed to a measure which would be approved by the Jacobins. His opposition made it impossible that the question should be taken up by the Ministry."[1] Besides the unfortunate fact that the Jacobins disapproved of the slave-trade, a negro insurrection in San Domingo helped to complicate the situation. Any reasonable human being would have looked on this incident as an additional argument against a system that went to increase the servile population of the West Indies; and it was accordingly pressed in that sense by Wilberforce. The general effect, however, was to "cool public feeling on the subject, and Pitt's zeal manifestly declined."[2] His colleagues, Dundas, Thurlow, and Jenkinson, showed zeal enough—but it was zeal for the trade; and in the House of Lords the Duke of Clarence, afterwards William IV., stood foremost

[1] *Dictionary of National Biography*, vol. lxi., p. 211.
[2] Lecky, vol. v., p. 341.

among those who fought against its abolition. The usual arguments urged for the continuance of man-stealing were regard for the commercial prosperity of England, and that other nations would take up the trade if we abandoned it. To which Fox replied that no gain would justify such a crime, and that highway robbery might be defended on the same plea. For their final victory the abolitionists were indebted to him, although it was not won till after his death. It might have been indefinitely postponed had Pitt lived; and, as it was, the trade more than doubled under his administration.

It is the chief glory of Pitt's life that he was most unwilling to engage in a war with revolutionary France, and only entered on it under compulsion. How that compulsion ultimately took effect still remains a controverted question—whether it came more from the reactionary fanatics of England, or from the regicidal fanatics of the Convention; or from neither of these, but from a blindly disastrous combination of circumstances. But it is beyond doubt that the first provocation came from Burke; that Burke wished for war long before it was declared, and that, once begun, he wished it to be carried on until the Republic was destroyed. And it is equally certain that Pitt, when he consented to fight, fought, at least ostensibly, against what he called Jacobinism in the same spirit of implacable hostility as Burke, one of his ablest colleagues, Windham, holding that the restoration of the Bourbons was the object of the war.[1]

[1] *Dictionary of National Biography*, vol. lxii., p. 174.

An Irish rebellion, provoked by the incompetence and mismanagement of the English oligarchy, occurred in 1798, and was put down with a severity accompanied by every circumstance of undiscriminating atrocity. True, these horrors were inflicted on Irish victims by Irish ruffians; but they were condoned by Pitt and the King. Lord Moira brought the matter twice before the House of Lords. "The Government refused to credit his account, or to interfere with the measures taken by the Irish Ministers to suppress the rebellion."[1] Two years later the very limited amount of self-government that Ireland possessed was taken from her by the lavish use of corruption, coupled with a promise of Catholic emancipation, which was not fulfilled.

Thus England, after taking rank fifty years before as the most glorious representative of European liberty, seemed at the end of the eighteenth century to have become its most determined foe, at home and abroad, in its highest developments and in its most elementary forms, lending to the cause of its oppression what had begun as the most potent instruments of its maintenance and extension—the supreme eloquence of Burke and the supreme energy of Pitt.

Immunity from resistance or criticism, concentration of all the national resources under one hand, and command of unprecedented wealth, had not created military power, nor given our aristocracy victory in the field. Warfare by subsidised coalitions did as

[1] *The Political History of England*, 1760–1800, p. 406.

little for the destruction of the enemy abroad as government by the corrupt management of competing interests did for the instruction of the people at home. Prussia took Pitt's money, and deserted him to secure her share in the partitionment of Poland. Austria took it, and fought his battles without success, until the more substantial bribe of Venetia reconciled her to an ignominious peace. As to the English troops, it is enough to say that they were placed under the command of the Duke of York, an utterly incapable general, for no better reason than that he was the King's son. When at last Pitt insisted on his supersession, George III. declared himself "very much hurt."[1] We shall see later on what sort of figure His Royal Highness made as Commander-in-Chief.

An abler commander than the Duke could perhaps not have done much better with the materials at his disposal. The officers were uneducated and the men undisciplined. It is remarkable that the only two generals who much distinguished themselves during the first French War—Sir Ralph Abercrombie and Sir John Moore—were both Scotchmen and both trained abroad. They divide the glory of having restored the old traditions of the British army and prepared the way for its Peninsular triumphs.

During the same period five great victories at sea carried England's naval reputation to the highest pitch it had yet reached, rivalling the glories of the French army, and showing Nelson

[1] *Political History, ut supra,* p. 362.

as the first sailor even more indisputably than Napoleon is the first soldier in history. Naval warfare, perhaps more than any other field, offers an opportunity for the exercise of that individuality which English liberty has done so much to develop, and of which Nelson is a supreme example. Nor was liberty alone the secret of our victories. The same democratic principle that made her rival so successful by land made England equally successful by sea—the principle of *la carrière ouverte aux talens*. Of our naval heroes Howe alone was nobly born; the Hoods and Jervis were middle-class men; Nelson, Collingwood, and Duncan came of good but untitled families, English or Scotch. The hardships of a sea life acted as a tolerably effective barrier in keeping out the idle, luxurious, and brainless young gentlemen by whom the other services used to be infested. But the Admiralty was in aristocratic hands, and its maladministration provoked a mutiny in the fleet which, occurring at a critical moment, put the existence of the Empire in peril.

Those years of oppression and military disaster were signalised by an extraordinary revival of British literature and science. Since the close of the American War very few books of permanent value had been written by Englishmen; and those who wrote what is still held to be worth reading were rather the survivors of an old than the inaugurators of a new time. "Poetry," as Macaulay observes, "had fallen into such utter decay that Hayley was thought a great poet." In fiction Fanny Burney passed for a prodigy.

English science was almost concentrated in Priestley, and was almost wrecked in the destruction of his books and apparatus by a Church-and-King mob. English philosophy, what little there was of it, lay buried in the manuscripts of Bentham. The Revolution seemed at first sight likely to increase this alienation from imaginative and speculative interests, in its commencement by offering the spectacle of a drama with which no fiction could compete, and in its later developments as the cause of agonising terrors for what so great a portent might bring forth. Only when those early hopes were dashed and those premature alarms appeased did the stimulus begin to take effect, and the energies that found no practical outlet begin to be turned into the channels of ideal emotion.

All the chief animating tendencies of what was to be the new literature had been at work long before 1789. A revived romanticism, noticed with alarm by Shaftesbury, had already begun under Queen Anne. There was genuine observation of nature in Thomson, enthusiasm for Greece in Collins, sense of reality in Cowper; all these together, combined with a new curiosity about Northern sagas, in Gray. The fertile *motif* of foreign travel had been successfully cultivated by Goldsmith. Yet these velleities of innovation, after a more or less prolonged struggle, had succumbed to the tyranny of convention ; and even in Cowper, or rather most of all in Cowper, the didactic had reasserted its sway.

Sympathy with American freedom did something to loosen the conventional yoke, but only the French Revolution could finally break it. The

first tendency to profit by the release was Romanticism. In this instance, however, the French influence was not unmixed ; republican ideas associated themselves more readily with Hellenic than with mediæval traditions. But it so happened that the first revelation of German literature came to England simultaneously with the first enthusiasm for France's political regeneration. At that time Unitarians either took the lead or followed closely on every new departure. William Taylor, of Norwich, who belonged to a Unitarian set, was the first Englishman to make a systematic study of German poetry, while also making himself prominent in the proceedings of the Revolutionary Society, a mildly Jacobin body. His translation of Bürger's *Lenore* (1790) first fully awoke the genius of Scott. Another young Englishman, Matthew Lewis, after learning German at seventeen, visited Weimar and was introduced to Goethe in 1792. Two years later he read Schiller's *Robbers,* and wrote a romantic story called *The Monk.* Visiting Edinburgh in 1798, he met Scott, encouraged him to translate from the German, and found him a publisher. Lewis himself had been stimulated by Ann Radcliffe's romance, *The Mysteries of Udolpho* (1794). Both this and its successor, *The Italian,* won enormous popularity, and bear witness to the sudden revolution in taste. Blake's *Poetic Sketches*, published in 1783, are deeply penetrated with the romantic spirit ; but their complete failure at the time shows how much the Revolution had to do with their ultimate success. Blake himself sympathised ardently with the Revolution, and his best poetic work, the

*Songs of Experience,* was evidently produced under its inspiration.

If by romanticism we are to understand the excitement of emotion by the imaginative presentation of extraordinary events, more particularly those of a really or apparently supernatural character, then unquestionably the chief, or rather the only, great poet of the school at its first beginning was Coleridge. On him the action of the French Revolution was intense, while the influence of German literature, as poetry, seems to have counted for nothing; for, though he read and admired Schiller's *Robbers* in an English translation, it can hardly have left a trace on the development of his genius. When he visited Germany it was to study not literature, but philosophy; and his most vital work in poetry was done before he went there, *The Ancient Mariner, Christabel,* and *Kubla Khan* having all been written in 1797. It may be noticed also in this connection that the first literary result of Coleridge's residence in Germany, his translation of Schiller's *Wallenstein,* had no success with the English public until several years later, no doubt because its classic form seemed out of keeping with the prevalent romantic taste.

Wordsworth and Coleridge were at first closely united by mutual admiration, by a common enthusiasm for the Revolution, by common studies in philosophy, and by a common dislike for the school of Pope; moreover, their association in the publication of *Lyrical Ballads* gave an impression that they represented a common literary movement. This, however, was a mistake; and, in fact, their

poetic methods were widely different. Realism is not romance, and Wordsworth was a realist. He took up and carried to a much higher power the naturalist current of eighteenth-century poetry; that is, the direct representation of elementary feeling, and of the scenes where such feeling is most freely displayed, depicted by preference under their most enduring aspects. And for this choice of subject and method French influence is to be thanked. The Revolutionists had sought to carry Rousseau's gospel of nature into effect; and when their aspirations were or seemed to be defeated, nature remained as an ideal refuge until the return of better times.

By a remarkable coincidence, the year 1797, which saw the publication of Ann Radcliffe's second great romance, *The Italian,* saw also the completion of Jane Austen's masterpiece, *Pride and Prejudice,* swiftly followed by *Sense and Sensibility* and *Northanger Abbey,* although not one of the three appeared in print until several years later. Of these novels the last-named is a direct protest against romanticism; and the same animus is present, although slightly veiled, in the second also. All three are reproductions, so far as they go, of actual contemporary life. No one would accuse Miss Austen of being a revolutionist; yet without the Revolution I question whether these novels would have been written. Her style is correct and temperate, but also to an extraordinary degree curt, direct, and trenchant. The epithets "exquisite" and "delicate" have been consecrated to her service with a stupid monotony which seems to show that the critics have failed to

recognise what is still more characteristic—her energy and decision. The word of command from the lips of a Nelson or an Arthur Wellesley could not be more peremptory or to the point. She breathes the air of a new time, demanding the swiftest resolutions in council, the most unwearied fortitude in execution. There is energy enough in the imperious self-assertion of Elizabeth Bennet and the headlong passion of Marianne Dashwood to furnish out a hundred heroines of later English fiction. And, with all Miss Austen's contempt for the vulgar *bourgeoisie,* there is something in the victory of Elizabeth over Darcy, as long afterwards in the victory of Fanny Price over the Crawfords and Bertrams, suggesting the rise of a new power before which the aristocracy of birth was destined to succumb.

Maria Edgeworth belongs to the same period as Jane Austen, and, like her, represents an intenser development of the earlier realism entering into rivalry with romance, illustrated by the same qualities of energy and decision in style. Her name has become identified with a didactic tendency characteristic of the whole century that gave her birth. But that tendency had also been powerfully stimulated by the Revolution, and is found mingling strangely with the visionary raptures of Blake and Coleridge no less than with the philosophic reveries of Wordsworth. One of the *Songs of Experience* is about a little sweep; *The Ancient Mariner* is a protest against field sports, *Peter Bell* a plea for humanity to the most despised and ill-treated of domesticated animals. Such teachings have obviously democratic affinities; and, as if to

point the contrast with aristocratic fashions, Windham, the model of an English gentleman, defended bull-baiting in Parliament.

The period from the Revolution to the Peace of Amiens is no less rich in scientific than in literary promise. Those years saw the first public appearance of Dalton, who constituted meteorology as a science, and to whom we owe the theory of atomic equivalents which is the basis of modern chemistry; of Davy, who analysed the alkalis into their elements, and proved by experiment the dynamic nature of heat; of Young, who discovered the phenomenon of optical interference, thereby placing the undulatory theory of light on an experimental basis; of William Smith, who founded stratigraphy by his laborious geological survey of England and Wales, and fixed its method by using the fossils found in rocks as a means of determining their relative antiquity. It was also in the middle of this period (1794–6) that Erasmus Darwin published his *Zoonomia,* in which Lamarck's theory of organic evolution is anticipated. Finally, the foundation of the Royal Institution, which gave Davy and Young an opportunity for expounding their great discoveries to popular audiences, falls in the year 1797.

It is to be observed that the English scientific work of the new age not only exceeds what had gone before it in amount, but also, and to a still greater extent, in quality. Cavendish and Priestley count only as discoverers of isolated facts, Priestley even remaining all his life obstinately wedded to a false chemical theory. Dalton, Davy, and Young were

as great theorists as they were experimentalists; Erasmus Darwin and William Smith gave science new methods of research.

The causes of this great and sudden expansion are more difficult to trace than the conditions of the literary revival which accompanied it. That it was connected with the Revolution seems highly probable, but in what way the connection came about is not obvious. It must be noted first of all that the leaders in the new science were without exception amateurs, and as such illustrate the characteristic individualism of the English intellect—an individualism likely to be still further accentuated in Dalton and Young by the fact of their being Quakers, and in Davy by his receiving lessons in science from a Quaker; and this independent character would be still further encouraged by the revolutionary environment. But why should so much of the newly-awakened energy discharge itself along the lines of physical investigation? I can only suggest that this happened because those ideal aspirations which the Revolution excited were debarred from seeking an outlet in political activity, partly by the conversion of the Revolution itself into a war of conquest and spoliation, partly by the repression of all reforming agitation in England under Pitt. It is noticeable, in this connection, that Macaulay has explained the analogous rise of English science after the Restoration by a diversion of energy from political to physical inquiries.

Another factor in the situation was the impoverishment of the country caused by Pitt's war-expenditure, diverting, as this did, large masses of capital from productive to unproductive

employment, besides imposing an oppressive load of taxation on the middle classes. Now, if it be true that an absorbing devotion to material interests was responsible for England's literary and scientific decline, it is at least possible that this subsequent depletion of wealth may have restored some of her best energies to the pursuit of more ideal ends.

At a time when France enjoyed undisputed supremacy in European science we might expect to find her influence at work in the revival of English science. But in this instance the French example does not seem to have counted for much. It is at least remarkable that the English were weakest where the French were relatively strongest —that is, in pure mathematics and biology. What we learned from them in these studies was learned at a much later period. Meanwhile America was, perhaps, more helpful. At any rate, it was Franklin's electrical discoveries that first roused Priestley's emulation ; and the Royal Institution was founded by an American, the brilliant and versatile Count Rumford.

In 1798 appeared the greatest single contribution to social science made since *The Wealth of Nations,* and one not surpassed in importance ever since. This was the famous *Essay on Population,* by Thomas Malthus, an English clergyman. Its origin is closely connected with the political circumstances of the time. As a consequence, presumably, of the distress caused by the American War, an amendment to the Poor Law, passed in 1782, and known as Gilbert's Act, "abolished the workhouse test and provided work for those who

were willing near their homes."[1] In 1796, at a period of much greater distress, the justices who had taken the place of the old Poor Law Guardians were "empowered to give relief to any industrious poor person at his own residence."[2] Thus it came to pass that "the labourers' wages were systematically made up out of the rates";[3] and as the allowance was increased in proportion to the number of children, not excluding bastards, a direct stimulus was given to the increase of the population, in perfect accordance with the apparent interests of the manufacturers and farmers, who wanted cheap labour, and of the Government, which wanted cheap food for powder, not to speak of the Tories, who wanted cheap philanthropy. Paley, the official moralist, held that happiness is equally diffused among all classes of society, and that its "quantity in any country is best measured by the number of the people."[4] Malthus was of a different opinion, while at the same time supporting Pitt's Poor Law Bill, whose ulterior consequences he seems not at first to have perceived. What ultimately seems to have suggested his destructive criticism of grants in aid of wages as a method for the relief of want was a searching examination of Godwin's *Political Justice*. It seemed to Malthus that the tendency of population to increase beyond the means of subsistence raised an impassable barrier to every scheme and every dream of social regeneration. Stated generally, his philosophy is that all the miseries afflicting society are so many expressions of the

ultimate fatality which prevents the limited additions to human food from keeping pace with the indefinite multiplication of human mouths. In point of fact, population has not increased at anything like the rate that would have been attained under the most favourable conditions; but this, according to Malthus, is chiefly because disease, vice, war, and famine have combined to check its normal growth; the removal of every preventable evil would merely leave mankind face to face with famine as the one insuperable enemy, and famine would bring back every other evil in its train.

Malthus afterwards came to admit that the practice of prudential self-restraint might be so developed as to keep the number of human beings within the limits of a comfortable existence; and as Godwin assumed that in a rational state of society such restraint would be habitually practised, the difference between them almost disappeared. At any rate, the *Essay on Population* merely applied to a particular case what *Political Justice* made the principle of all progress—the substitution of conscious, rational prevision for blind and violent constraint.

Since Malthus wrote, his law has been extended to the whole organic world, and has been exhibited as the sole cause, or at least a prime cause, of organic evolution. But Malthus had already grasped the possibility of such an application within the limits of the human species. Without dreaming of any change in its fundamental constitution, he represents the pressure of population on the means of subsistence as a divinely appointed

instrument for the perpetual exercise and enhancement of man's industry and ingenuity. He failed to see that a result which would equally have come about in the absence of supernatural guidance leaves the case for theism no stronger than before. And, of course, he still more thoroughly failed to see that his principle would become the basis of a vast theory destined, in the opinion of some, to supersede theism altogether. Meanwhile the Essay told as a trenchant criticism on Pitt's Poor Law, and led to an immediate reconstruction of scientific economics.

The French Revolution had been prepared by a philosophy in which destructive criticism on theology played a great part; it had been conducted by professed unbelievers, who began by confiscating Church property and ended with a proscription of the priests who took their orders from Rome. In England Burke had denounced it as anti-religious and as quite alien from the essentially religious genius of the English people. He referred to the English Deists as long extinct, and to their writings as forgotten. It would have been more correct to say that Deism had not set up any organised effort to strip the Anglican Church of her temporalities; but this was rather the result of a tacit compromise with Rationalism than a sign of its defeat. Since Hume, freethought had been spreading among the higher intellects, and with some had doubled the area of its original negations. Gibbon, the greatest of modern historians, counted among the assailants of Christianity; Bentham and Erasmus Darwin were known in private to be atheists; Romilly and Mackintosh seem to have

been Deists; Fox had no religious beliefs, nor, as would appear, had Pitt either.[1] On the other hand, the Church of England, while remaining nominally orthodox, had in practice become a teacher of what amounted to little more than a purely ethical religion, insisting on no dogmas beyond a personal God and a future life as sanctions of morality. Meanwhile a number of Nonconformists, grouping themselves under the name of Unitarians, compromised more openly with Deism by renouncing the dogmas of Original Sin, the Incarnation, and the Atonement.

Against this movement for transforming religion into simple morality a double protest was raised—by Methodism outside the Church and by Evangelicalism within it. Evangelicalism had gained access to the highest political circles in the person of Wilberforce, but otherwise had little hold on the intellect of England.

It has been shown with what energy the revolutionary atmosphere acted on all the latent tendencies of English life and thought, quickening the sense of possibility on the one hand and the sense of actuality on the other. It could not, therefore, fail to rekindle the old conflict between the appeal to a supernatural revelation and the exclusive reliance on nature which had divided opinion half a century before.

The first to break silence on the Rationalist side was Thomas Paine. Part I. of his *Age of Reason* appeared in 1794; Part II., a work of much greater importance, in 1795. Paine's natural bent was

[1] J. M. Robertson, *A Short History of Freethought*, vol. ii., p. 177 (2nd ed.).

towards science; circumstances made him a democratic politician. He founded the alliance of Rationalism with science and democracy. Attracted at an early age by astronomy, he could not reconcile the very insignificant place in the universe occupied by our earth with the overwhelming importance ascribed to its human population by the scheme of salvation. But in rejecting that scheme as represented by the current Christianity he did not rely exclusively on the *a priori* arguments that astronomy suggests. Admitting the possibility of a divine revelation, he denies that any has been made to man beyond the structure of the universe itself. Part II. of the *Age of Reason* goes through the Bible with the object of showing that much of what it contains is inconsistent with the theory of its divine authorship. If Paine added nothing to what the English and French deists had said before him, he brought together the substance of their attacks on the Old and New Testament stories, and restated it in a clear, popular style. Much of what he said was afterwards practically conceded by Coleridge, and has since been more or less openly admitted by many who claim to be Christian believers.

Although originally intended for the French rather than for the English public, it was in England that the *Age of Reason* proved most successful; and an attempt was at once made to stop its circulation among the poorer classes, the shilling edition being suppressed while the half-crown edition remained unmolested. For selling one copy a bookseller named Williams was prosecuted and sentenced to a year's imprisonment

(1797). But this seems to have been an isolated case; nor did persecution for propagating unbelief at that time rage with anything like the virulence displayed a quarter of a century later.

Paley's *Evidences of Christianity,* long the official text-book of orthodox apologetics, appeared in the same year as Paine's attack, but without reference to it. The main positions defended are: That miracles are not antecedently incredible to anyone who believes that the world was created by a personal Being; that Christianity could not have been introduced into the world without a display of divine authority involving some departure from the usual course of nature; that such a departure was justified by the end in view; that miracles performed for that purpose are recorded and abundantly attested in early Christian literature; that the authenticity of the books containing their evidence is certain; and that the credibility of the witnesses is established by their willingness to undergo cruel torment rather than renounce their belief, as also by their acceptance of a severe morality on the strength of the Gospel promises.

In the present state of criticism it is clear to all, and it must have been clear to many in his own day, that Paley's case rests on a series of assumptions inconsistent with religious psychology and with the results of New Testament criticism. But his steady reliance on pure reason as distinguished from the methods of authority and mysticism, his clear-headedness and dialectical ability, furnish one more instance of the increased intellectual seriousness which the French Revolution had communicated to the English genius. And the need for

such a defence shows how pressing the attack had become.

Paley's *Evidences* sought to show that the Christian religion was a supernatural revelation. A few years later Wilberforce, in his *Practical View of Christianity,* achieved something much greater: he showed what that religion actually was. It is not, according to him, what the eighteenth century vainly imagined, an ethical code armed with new sanctions; but, first of all, an explanation of the fact, universally recognised as such by everyone who has eyes to see, that man is by nature and fatal heredity an utterly corrupt creature, alienated from his Creator, and justly subject to awful penalties for that original apostasy. The Christian revelation tells us that from that lost condition there is one way of escape, and one alone. It has been furnished by the self-sacrifice of Jesus Christ, who vicariously took upon himself the punishment due to our sins, and whose satisfaction we may henceforth plead, if we accept it, in discharge of our liabilities before God. Without that plea the austerest virtue cannot save us; but the austerest virtue is felt as a life-long obligation by him who has accepted the transfer of his sin and its consequences to the Redeemer. God must reign without a rival in the thoughts and affections of the true believer; and on one day of the week he must think of nothing but God.

This conception of human life as the prelude to man's eternal existence under the form of a disembodied spirit, and interesting only by reference to another disembodied spirit eternally distinct from the world, was the very essence of the religious

movement begun two generations before by William Law and John Wesley, and remodelled a generation later by Keble and Newman. It is the form given by minds of a certain constitution in a certain stage of culture to the claim that disinterested, ideal ends shall be made paramount over the selfish, frivolous, and fleeting satisfactions of a merely animal existence. To realise those obligations under concrete personal forms gives them at first an extraordinary grip on the affections and the will, but eventually compromises and corrupts their idealism by union with a perishable body of class-interests and unwarrantable beliefs, frequently degenerating into abject superstition. Wilberforce and his co-religionists led the agitation for the abolition of the slave trade and slavery, which, however, would neither have begun nor have succeeded without the co-operation of men who stood at the opposite pole of thought. But they were out of sympathy with the scientific and literary glories of the age; their religious scruples long hindered the advent of popular education, and their credulous conservatism made them the natural enemies of all reforms directed towards benefiting the people with the aid of the people itself.

## Chapter III.

## THE EPIC OF NATIONS

The war between England and Napoleon from 1803 to 1814–15 is generally regarded by historians as a simple continuation of the war between England and the French Republic from 1793 to 1802. And this much is true, that the personal hostility of Napoleon to England, as the chief obstacle to his design of creating a world-empire, had already begun to show itself when, as General Bonaparte, he led a French expedition to Egypt with the object of making it a stepping-stone to the conquest of India. But, apart from what the necessities of self-defence demanded of her, the attitude and intention of England in the second war differed widely from what they had been in the first. She had then appeared as the champion of order against license; she now appeared as the champion of liberty against oppression; while, conversely, the sword of France was transferred from the cause of emancipation to the cause of spoliation and enslavement. On France's side, indeed, the change had been long in progress, and the Republic must share the responsibility for it with the Empire. Coleridge's great *Ode to France* lives as an immortal record both of her shameless aggression on Switzerland and of its effect in alienating the sympathies of some that even the Terror had left unshaken supporters of her

democracy. But England as a State had never pretended to fight for Switzerland any more than for Venice; and the restoration of the Bourbon monarchy continued to be the avowed object of her rulers until the haughty rebuff of the First Consul brought them to their senses. The second war, on the other hand, though nominally engaged on the question of our retention of Malta, was really provoked by new French aggressions on Holland and Switzerland. From the beginning England's own independence had been at stake; in five years the war became a struggle for the deliverance of the Iberian Peninsula, in which the Portuguese and Spanish peoples fought on our side; the Tyrolese were next enlisted in the same cause; then came the heroic resistance of the Russian people; and, finally, the whole German nation rose in arms against the tyranny of Napoleon.

English public opinion could not fail to be affected by so vast a transformation of the questions at issue. During a war avowedly waged for the restoration of liberty, the friends of liberty could no longer be denounced as Jacobins; and, although there was still wide disagreement about our Continental relations, the dividing line ran more on policy than on principle. It became the fashion in Whig circles to throw doubt on the regeneration of the Spanish people—as subsequently appeared, not without good reason—and to predict the eventual failure of our arms in the Peninsula—as, had it not been for Napoleon's incalculable Moscow campaign, they would, in fact, have failed. But no party wished the French to win, or regarded their victories as other than defeats for freedom. Even

before the Spanish rising William Cobbett, the most popular of Radical journalists, denounced Napoleon as a military despot, and ardently advocated the continuance of the war until his empire should have been shorn of those maritime conquests which made it a perpetual menace to the independence of England. And he also had the highest hopes of our ultimate success, if English arms were brought into alliance with the popular revolt against French oppression.

The change of opinion brought about by this altered aspect of foreign politics could not fail to react on the balance of parties at home. The coalition of the majority of the Whigs with Pitt, the acceptance of a royal pension by Burke, and the secession of Fox from Parliament had marked the lowest depth to which Liberalism ever sank in modern England; while the final destruction of Irish autonomy a little later had completed the triumph of reaction. A few years afterwards Pitt himself was making overtures to Fox which, had they been successful, would have resulted in giving his great rival an equal share of power. Owing to the King's dislike of Fox the negotiations fell through; but on Pitt's death even George III.'s obstinacy had to give way, and the Whigs returned to power for the first time since 1783, their brief predominance being signalised by the abolition of the slave trade, which had been impossible so long as Pitt lived. On two subsequent occasions they might have secured a considerable share of office under the Prince Regent had not the demands of their leaders been pitched too high.

It has been already mentioned that Pitt carried

the Union with Ireland partly by an informal promise to the Irish people that the law excluding Roman Catholics from Parliament should be repealed. We cannot doubt his sincerity, but he had reckoned without the King. The Archbishops of Canterbury and Armagh got hold of the royal ear and persuaded George III. that for him to agree to such a measure would involve the violation of his coronation oath and the forfeiture of his Crown. Finding that his master's scruples could not be overcome, the great Minister honourably resigned, and Addington, an incompetent favourite, was installed in his place. Never since the accession of the Hanoverian dynasty had the power of the Crown been so signally or so disastrously exercised. And, as a further aggravation of its absurdity, at this very crisis the King was overtaken by one of those fits of insanity the very liability to which would have permanently excluded him from any inferior office of authority. It operated in this instance to strengthen his position. By threatening to go mad if Catholic Emancipation were ever again mentioned to him George III. succeeded in exacting a pledge from Pitt and all Pitt's successors that silence should be kept on so irritating a subject.

As parties grew more evenly balanced the power of the Crown became more and more a decisive factor in the situation, those who yielded to the royal will naturally having the advantage of those who defied it. But the Tories who were King's men ultimately had to pay dear for their degrading subservience, as indeed also had the Crown itself by the loss of all its authority. On the other hand, the new exercise of prerogative proved the salvation

of the Whigs. By refusing to take the King's pledge they acquired an unwonted dignity, and even a certain moral splendour. The old charge of greed for office could no longer be urged against men who sacrificed office to a scrupulous regard for honour, peace, justice, and toleration. The charge of aristocratic exclusiveness fell pointless against the champions of a despised and down-trodden race. The charge of adhering to anti-quated shibboleths seemed ridiculous as against the generous orators whose programme was so enlarged as to include respect for a religion their ancestors had long proscribed. The charge of truckling to popular clamour grew ever more irrelevant as the mob came to side with the King, whose prejudices they shared.

Nor was this all. If the Whigs won by taking up Emancipation, their enemies lost to an even greater degree by not accepting it. The Crown became a symbol of unpatriotic obstinacy and folly. Nearly all the Whig leaders who had allied themselves with Pitt in 1794—Grenville, Fitz-william, Spencer, and Windham—accepted the Catholic claims and returned to their old allegiance. Some of the ablest Tories—Canning, Castlereagh, the Marquess Wellesley—while remaining within the party, sided on that question with their political opponents, and thus formed a continual source of embarrassment to their associates, terminating in open disruption when the Protestant leaders them-selves accepted Emancipation—a catastrophe by which the power of the Crown was finally destroyed. Meanwhile, the Catholic gentlemen of Ireland were driven into the arms of the Irish people, thus

helping to create a new difficulty for the English aristocracy and a new link between the cause of suffering nationalities and the cause of European liberty.

Although resumed under far different auspices, the war with France long did as little to overthrow the new despotism as had been done in the previous decade to overthrow the new democracy. Even where they were not directly pitted against individual genius, our incapable oligarchy continued to pile up disaster and debt. An expedition to Buenos Ayres was placed by Court influence under the command of General Whitelocke, whom a court-martial subsequently declared "unfit to serve his Majesty in any military capacity whatever."[1] It terminated in the defeat and capitulation of a strong British force. A far more important expedition to the Low Countries was ruined by being placed under the command of a royal favourite, Lord Chatham, whose incompetence did not escape even his own brother, Pitt. Expeditions against Constantinople and Alexandria came to an equally ignominious end. Finally, a war with the United States, for which the lawless arrogance of our rulers is chiefly responsible, was signalised by the defeat of General Packenham at New Orleans, with the loss of 3,000 Peninsular veterans.

It must not be supposed that our naval was much better than our military administration. After Nelson by his individual genius had annihilated France's sea power, French privateers continued to infest the English coast and to capture

[1] *Political History of England* (1800–1837), p. 57.

English vessels in full sight of English men-of-war.[1] During the American War the conflict at sea was generally carried on by duels between frigates, in which the Americans were most frequently victorious. This was due to no deficiency in seamanship or gallantry on our side, but to the fact that our champions were invariably over-matched, being ignorantly allowed to engage what, although called frigates, were almost equal to ships of the line. And that such ignorance prevailed was due to the intelligence department—if it deserves that name—of the English Admiralty. For, shortly before hostilities began, one of these so-called frigates had anchored at Spithead, and offered an opportunity for estimating her fighting strength as compared with our own frigates, which opportunity was utterly neglected.[2]

When the hour of victory arrived the same military mismanagement contrived to throw its fruits away. Fortune placed at the disposal of the oligarchy a young general, sprung from their own ranks, gifted, for a wonder, with military genius, and, by a greater wonder still, with the genius for making the most of it by assiduous cultivation. Arthur Wellesley, although of noble birth, was saved from the usual temptations of his order by a fortunate poverty which caused him to be removed at an early age from Eton to a French academy, and which, when his school days were over, obliged him to work for his living. Aristocratic connections gave him the one thing he had to thank them for—early and rapid promotion. India practised him in

[1] *The Croker Papers,* vol. i., p. 33. [2] *Ibid,* p. 45.

the exercise of command. The best humanitarian traditions of the eighteenth century acting on a naturally kind heart imbued him with a habitual, and, as it happened, most politic consideration for the sufferings and susceptibilities of alien and helpless races.

In 1808 an opportunity offered itself to the English Government for employing this young hero in Europe. Castlereagh, at that time War Minister, gave Sir Arthur Wellesley the command of a small expedition sent to deliver Portugal from a French invasion. A few weeks after disembarking his troops at Lisbon, he defeated Marshal Junot in the decisive battle of Vimiero, only to find the fruits of victory torn from his grasp by an incompetent favourite of the Horse Guards. Castlereagh had persuaded his colleagues to raise the strength of the expedition from ten to thirty thousand men, but his efforts to place the enlarged force under Wellesley's command were baffled by the King.[1] No sooner had the victor of Assaye set sail than "two senior officers of no special ability,"[2] Sir Harry Burrard and Sir Hew Dalrymple, were placed over his head. Burrard arrived on the field of Vimiero at the moment when Sir Arthur was about to launch his reserves on the retreating French columns, just in time to assume the command and to forbid the pursuit, which would probably have ended in the unconditional surrender of Junot's whole army. As it was, on the very next morning Dalrymple, who in his turn had superseded Burrard, received proposals for a

[1] Lord Holland, *Further Memoirs of the Whig Party*, p. 15.

capitulation from Junot. But by this time the French had occupied a position of such strength that, so far from surrendering, they were able to insist on being conveyed to their country by English ships, taking with them all the plunder they had amassed, and with a guarantee of immunity to the Portuguese traitors who had abetted their designs.

The Convention of Cintra, as it was called, aroused a storm of indignation in England, and the generals were put on their trial. On examination by a court of inquiry they were honourably acquitted; but Burrard and Dalrymple were not again employed, whereas Wellesley received the sole command of another expedition to Portugal in the following year. It is said that the Duke of York, undeterred by his disastrous experience in Flanders, had intended to claim that position for himself, and that his purpose was only defeated by certain scandalous disclosures so opportunely sprung on the public as to suggest a suspicion that the somewhat ignoble personage who brought them before Parliament, one Colonel Wardle, was really acting on behalf of the War Office, whose responsible heads had no other means of keeping the Duke at home.[1] At any rate, it appeared that the mistress of the Commander-in-Chief, an actress named Mrs. Clarke, gave out that her royal lover allowed himself to be guided by her recommendations in the choice of officers for promotion, and that, on the strength of this alleged favour, she had opened an office for the private sale of commissions. That such transactions did take place there could

[1] This is hinted by Lord Holland, *Further Memoirs of the Whig Party*, p. 16.

be no doubt; the only question was whether the Duke had a guilty knowledge of them or not. The most plausible theory seems to be that he was innocent, but that, being a very loquacious person, he let Mrs. Clarke into the secret of his intention to bestow free commissions on certain deserving candidates, and that she profited by the information to levy toll on them under the pretence that the promotion which would anyhow have been theirs had been obtained by her interest.[1] On any view the affair was a scandalous one, and the Duke, though acquitted of connivance with his mistress's practices, had the decency to resign. His brother, the Prince Regent, subsequently restored him to the Command-in-Chief, an office which he otherwise filled very creditably; but by that time the supposed object of the Parliamentary attack had been gained, and, whatever else Sir Arthur Wellesley had reason to complain of, Court influence could no longer be turned against him. Nobody seems to have noticed in this affair that the objectionable thing was for commissions in the army to be sold by anyone to anyone on any terms.

None gave such eloquent expression to public feeling at this time as the poet Wordsworth, in a pamphlet on the Convention of Cintra. In a private letter the author of *The Prelude,* then not yet a "lost leader," prescribes two things as "absolutely necessary to the country—a thorough reform in Parliament and a new course of education."[2]

The new education of public opinion had already

begun years before Wordsworth wrote those lines —with little help or countenance, it must be owned, from the poet himself—under the form of a strenuous criticism on contemporary literature and life. The first collective impulse came from Edinburgh, with its brilliant University, its intellectual society, and its highly cultivated band of advocates. Among the forces making for culture and freedom in the northern capital, Dugald Stewart, Professor of Moral Philosophy since 1785, must be given the foremost place. As a thinker Stewart merely expounded Reid's shallow and reactionary metaphysics. But, as an educator and orator of the Chair, he exercised an unrivalled power of exciting noble enthusiasm among his young hearers. In society he was supported by a wife of surpassing charm and high intellectual interests, the "Ivy" of Lord Dudley's recently published letters. With the closing of the Continent it had become usual for English families of distinction to visit or even to reside at Edinburgh for pleasure or education; and, among others, the sons of great Whig magnates were sometimes sent to sit at the feet of a teacher who, even under Melville's reign of terror, had made no secret of his sympathy with the Revolution. Among his pupils were two future Prime Ministers, Russell and Palmerston, to whom must be added Lord Henry Petty (afterwards Lord Lansdowne), Ward (afterwards Earl Dudley), and Lord Webb Seymour. Some years later we find another future Whig Premier, William Lamb (afterwards Lord Melbourne), studying under Professor Millar at Glasgow.

From this fertilising contact between the English and Scottish intellects arose the *Edinburgh Review,* long the chief organ of Liberal opinion in Great Britain. The first idea of it was due to an Englishman, the great humorist Sydney Smith, who also edited the opening number, published in October, 1802; but much the greater mass of contributions came from Scotch lawyers, among whom Jeffrey, Horner, and Brougham stood foremost for ability and power. In after years also the only articles of permanent literary value, with the possible exception of Sir James Stephen's, were written by Carlyle and Sir William Hamilton, who were Scotchmen, or by Macaulay and Mill, whose fathers were Scotch.

Carlyle has described Jeffrey as the greatest of destructive critics. But this is a complete misrepresentation. Although holding rationalistic opinions, Jeffrey never attacked the reigning theology in print. Nor were his politics democratic, although he wished to reinforce existing institutions with a large popular element, advising the Whig aristocracy to seek support among the people. Unlike some other Whigs, he hated Napoleon; but, being of a desponding temperament, he opposed the Spanish policy of the Government—which, after all, only succeeded by a happy chance— a step which led to the severance of Walter Scott from the *Edinburgh Review,* and the transference of his support to the *Quarterly Review,* founded in 1809 as the chief organ of the reactionary principle in politics and literature.

On the whole, we may say that the principles of the *Edinburgh,* as guided by Jeffrey, coincided

with the central line of English political progress for the next two generations after its birth; but to maintain the movement in that line forces of a more radical direction had to lend their aid.

At that time the chief Parliamentary representative of the Reform party in England was Sir Francis Burdett, and its chief literary representative was William Cobbett. Each in his way did good work, but it was critical rather than constructive. The real founder of English philosophical Radicalism was a Scotchman, James Mill. This remarkable thinker, according to George Grote the greatest intellect that he had ever encountered, owed his enthusiasm for philosophy to Dugald Stewart, and perhaps his enthusiasm for liberty also. At any rate, he came up to London in 1802 a confirmed Liberal, though no Jacobin. His intimacy with Bentham begins not later than 1808. During the Revolution Bentham had been a high Tory. In 1809 we find him writing a Catechism for Reformers, in which universal suffrage is advocated. The dates suggest that he had been converted by Mill.[1] At any rate, Mill is henceforward the centre of what has come to be known as the Benthamite school. Dumont had first revealed Bentham to England and to all Europe by his French version of the *Theory of Legislation,* published in 1802. James Mill allied Utilitarianism with the political economy of Malthus and Ricardo, with the associationist psychology of Hartley, with a renewed study of Greek ideas, and with a comprehensive educational system, embracing all these as

[1] Elie Halévy, *Le Radicalisme Philosophique,* vol. ii., p. 196.

its elements, of which his illustrious son offers, so far, the only complete example. It is probable, as I have said, that he also allied Utilitarianism with democracy. Under his guidance the school adopted that extreme view, long supported by English Radicalism, for which the moderate Whig Reform Bill was finally substituted as a working compromise, with James Mill's complete approval. But this belongs to a period at which we have not yet arrived.

What best proves the growing liberality of the Napoleonic period is the spread of education among all classes and the lively interest shown in competing schemes for the education of the people. J. W. Ward, Dugald Stewart's pupil, who took his B.A. at Oxford in 1802, on revisiting the University in 1812 finds to his astonishment that during those ten years it has been transformed into a place of education. Examinations have ceased to be a matter of form; rioting and drunkenness are quite exceptional; idleness is discreditable, and reading the correct thing.[1] Writing between three and four years later, Coleridge contrasts the steady and serious tone of both Oxford and Cambridge with what it had been thirty years before, mentioning particularly "the zest in the pursuit of knowledge and academic distinction in a large and increasing number,"[2] associating it as part of a more general movement with "predominant anxiety concerning the education and principles of their

children in all the respectable classes of the community." Godwin, with ideals very unlike Coleridge's, observes, writing to Shelley in 1812, that between then and twenty years before the alteration in the men of these islands and of Europe was immense, greater progress having been made during that interval "than in any hundred years preceding."[1] And Jeffrey, no optimist, writing in 1809, tells the readers of the *Edinburgh* that "the people are, upon the whole, both more moral and more intelligent than they ever were in any former period."[2] In a word, from the time that we ceased to assail the French Revolution—and even a little before—its true principles began to spread and thrive among us.

Among the higher and middle classes the new demand for education was met to a considerable extent by existing endowments and by voluntary efforts. The demand for primary education had to struggle not only against the want of endowments, but also against the undisguised hostility of some among the well-to-do. "If there was any principle reverenced as indisputable by almost the whole adherents of the party in power," even little more than a century ago, "it was that the ignorance of the people was necessary for their obedience to the law."[3] Accordingly, even an unsuccessful attempt to do away with that ignorance by legislation must be noted as a sign of the times. Under Grenville's Ministry (1807) Whitbread, a prominent Whig, brought in a Bill providing free education for the

poor in every parish throughout England. After passing the Commons against Windham's passionate opposition, probably in the assurance that it would be rejected by the Lords,[1] it was duly rejected, three Bishops voting for the Bill and fifteen against it. Archbishop Manners Sutton objected to Whitbread's plan that it would take education from the control of the Establishment—in his opinion a most dangerous innovation.[2]

Meanwhile private enterprise was supplying the place of State action. Several years earlier Andrew Bell, an East Indian army chaplain, had struck out a system of mutual instruction in schools, known afterwards from the place of its origin as the Madras method. The same idea occurred independently to Joseph Lancaster, a Quaker schoolmaster in London, who put it in practice on a large scale, carrying on an active propaganda for the system in all parts of the kingdom, and securing the support of sundry royal and noble patrons. With their aid he founded in 1809 the Royal Lancastrian Institution, a name afterwards changed to the British and Foreign School Society. Lancaster was a very religious man, but his plan was to teach religion simply by reading the Bible. Church people objected to this as tending to undermine the Establishment. Their attacks on Lancaster stirred up Bell to start a rival agitation for placing elementary teaching under the control of the Church. His efforts led to the foundation of the National Society in 1811. Between the two systems a bitter feud

[2] Clayton, *The Bishops and Legislation,* p. 59.

sprang up, and has continued down to the present day. The leading Whigs and the *Edinburgh Review* sided with Lancaster, the Tories and the *Quarterly* with Bell. Herbert Marsh, afterwards Bishop of Peterborough, for those times a wonderfully liberal Biblical critic, made himself remarkable for the energy he threw into the sectarian cause; and Coleridge, the most advanced theologian of the day, lost no opportunity for attacking Lancaster with ludicrous animosity.

As an instrument for imparting knowledge the Madras method eventually broke down; but the Bell and Lancaster schools gave an impulse to popular education that has never since died out; while the feud between the two systems has brought religious differences into a stimulating connection with party politics, and raised both into the sphere of high national interests.

In physical science the period of the second French war fulfilled to some extent the promises of the revolutionary epoch, but was less productive of original thought. England suffered intellectually by her long isolation from the Continent. None were found to develop Erasmus Darwin's evolutionary ideas. Young's undulatory theory of light was allowed to be crushed by Brougham's ignorant and insolent criticism of it in the *Edinburgh Review* (1803). The most important pioneer work was done by two Scotchmen, Dr. Thomas Brown and Sir Charles Bell. Brown, in his treatise *On Cause and Effect,* took up Hume's theory of causation and introduced the idea of invariable sequence into the philosophy of science. Bell in 1811, after

four years of investigation, announced the distinction between the sensory and motor nerves, and explained the nature of their connection with the spinal cord. It seems characteristic of the time that both achievements were rather analytic than synthetic and constructive, probing phenomena to the bottom, not exhibiting them in their systematic connection. Thus they fall into line with Davy's contemporary decomposition of the alkalis rather than with the great theories of Dalton, Young, and Erasmus Darwin.

As compared with the revolutionary period, literature also shows a distinct decline both in poetry and fiction. The French and German inspirations had spent much of their force. Romanticism still prevails, but declines on a more realistic plane of representation. As a part of this realism we find the popular poets of the age reflecting the new political situation created by the resistance to Napoleon's aggressive career. On the Tory side we have Scott's series of versified narratives, romantic indeed, but strictly subordinating the emotions of wonder, terror, and sexual passion, so freely employed by his predecessors, to the motives of picturesque historical association, of local colour, and of loyalty, whether under the form of national patriotism or of the intenser devotion given by a clansman to his chief. On the Whig side we have Byron's first two Cantos of *Childe Harold,* where a certain reluctant sympathy with the victims of French rapacity and with the English armies sent to deliver them struggles against a good Foxite's dominant detestation of all

war as such; while the romantic use of horror and voluptuousness as imaginative excitements is not forgotten, and hollow eighteenth-century abstractions still crowd the scene. But in the portions giving the new poet's impressions of modern Greece reminiscence becomes prophecy; the traditions of republican liberty and heroism derived from Harrow and Cambridge spring to life before the entrancing spectacles of Parnassus and Marathon, consecrating this young English nobleman to be the future augur and leader in the coming war of opinion where the spirit of nationality and the spirit of individual liberty, retrieving France's errors, were to combine their forces against the spirit of feudal and absolutist reaction.

*Childe Harold* was followed by a series of dazzling metrical romances in which the same sympathy with Greece and the same hatred for her Turkish oppressors ally themselves to a general spirit of revolt against cramping conventions. Byron's extravagant admiration for the great literary conventionalist, Pope, seems at first sight inconsistent with such an attitude. But it was merely another aspect of his pervading liberalism. By Pope Byron meant the classic tradition of English poetry, the side on which it represented republican liberty as against the reactionary romanticism of Coleridge, Southey, and Scott.

Byron's friend Moore contributed to the cause of nationalities by the publication of his *Irish Melodies* in 1807. As poetry they have little value, but the musical accompaniments to which their author sang them in Whig drawing-rooms gave the words and sentiments a certain social importance, and

combined with his versatile productivity, particularly as a biographer, to make him a power in the party.

Wordsworth continued a political Radical till the end of the war, supporting the various patriotic movements against Napoleon, but still an ardent admirer of Fox; still, as we have seen, a Parliamentary Reformer; still no Christian, but a Platonist in the *Ode on Immortality*; still a pantheist in the *Excursion* (1814); and, what is perhaps even more significant, in the same poem an advocate of universal education.

Maria Edgeworth, in the silence of Jane Austen, the greatest novelist of the period, obeys the same tendency by striking into the didactic vein which she never afterwards forsook. Her Benthamite morality, too, offers a silent but not unregarded protest against Evangelical mysticism.

It has often been observed that without the industrial revolution England could never have fought the war with Napoleon, still less come out victorious from the conflict with that almost superhuman genius. But, in fact, had it not been for the industrial revolution there would have been no war, or at least none on so vast a scale. The English colonisation of America, the English conquest of India, had been largely suggested by the hope of gain. Both had been disputed by France with the object of diverting that gain to herself. In both regions French ambition and enterprise succumbed before the genius of the elder Pitt. Twenty years later it was imagined that the loss of her North American colonies would involve the commercial ruin of the mother country;

and the object of her old rival in helping the insurgents was to hasten on that consummation, which the English Government on its side fought desperately to avert. Both were deceived. The defeated power gained enormously in wealth, while the victorious Bourbon monarchy paid by its own extinction for an act of treason against constituted authority, just as the New Monarchy in England perished by the reaction of that very Reformation whose success it had secured in order to destroy the last check on its despotism a century before.

French policy, however, survived the Bourbons, and even provided itself with a far more powerful instrument. When the first ferment of the Revolution had subsided the adventurer whom it raised to supreme eminence in the State at once took up the tradition of his predecessors and rushed to strike for India once more, this time taking the path of Alexander through Egypt and Syria. In the pursuit of that chimera he lost a fleet and an army, and nearly wrecked his own career; but, returning to France a fugitive, won her throne by a lucky throw, and sat down once more with full pockets to play the game of universal empire at a board where European kingdoms were counters, India and Asia remaining the stakes through it all. To defeat England's German and Russian allies in the field was the least of his difficulties, each military success counting but as a means towards the higher end of undermining her commercial position, each new invasion being determined by the fatal necessity for closing every Continental market to her trade. His tragic Peninsular and Russian expeditions were undertaken that the excluding cordon might

be extended without a break from Riga to Lisbon, and round again from Lisbon to Odessa.

In the battle between the French Revolution and oligarchy revolution had won. But in the battle between the industrial revolution and militarism industry won. It seemed as if England's material resources were multiplied by the very measures taken to destroy them. Napoleon's Continental system, originally adopted as a reply to the paper blockade of the coast from Brest to the Elbe, was in its turn met by an Order in Council "forbidding neutrals to trade between the ports of France and her allies, or between the ports of nations which should observe the Berlin decree, on pain of the confiscation of the ship and cargo."[1] Its effect was to throw the whole carrying trade into British hands. At the same time our immunity from invasion, combined with the relative insecurity of Continental industry, gave us a manufacturing monopoly. As a consequence of this privileged position the trade of the United Kingdom, measured by the sum of its exports and imports, was in 1815 exactly double what the trade of Great Britain had been in 1795.[2] "The value of taxable income from lands, houses, etc., was estimated at forty-five million pounds in 1798 and at sixty millions in 1815."[3] "The Census of 1801 showed an increase of eleven per cent., the Census of 1811 an increase of fourteen per cent., the Census of 1821 an increase of twenty-one per cent."[4] The tonnage of shipping belonging to Great Britain

and Ireland increased over sixty-two per cent. between 1793 and 1813.

But as the political revolution in France had greatly increased the power of the central Government, so the industrial revolution in England made the rich richer and the poor poorer. It was the capitalist manufacturers who gained by the increasing volume of trade, while the landholders gained both by agricultural improvements and by the rise in the price of corn. Wheat rose from 49s. 3d. per quarter in 1793 to 69s. in 1799, to 113s. 10d. in 1800, and 106s. in 1810.[1] This was partly due to legislation. "In 1791 a duty of 24s. 3d. was imposed as long as English wheat was less than 50s. a quarter; if English wheat was over 50s., the duty was 2s. 6d. In 1804 foreign corn was practically prohibited from importation if English wheat was less than 53s. a quarter; in 1815 the prohibition was extended till the price of English wheat was 80s. a quarter."[2]

Meanwhile the cost of paying for the war was thrown as much as possible on the poor, every necessity and convenience of daily life being taxed, and the incomes of capitalists and landowners not paying their fair share.[3] By the system of supplementing agricultural wages from the poor-rate the farmers were even enabled to throw part of the maintenance of labour on householders who often could ill afford it.

Strikes were penal. "The Act of 1800 was applied to all occupations, unions, or associations

of workmen for the purpose of obtaining an advance in wages or lessening the hours of work."[1]

This Act seems to have been passed without any debate. The penalty for violating its provisions was three months' imprisonment without, or two months with, hard labour.[2]

The wages to increase which the recipients could not combine are described as "excessively low."[3] "In 1800 the average wages of artisans were 18s. a week in London. They gradually rose by about seventy-five per cent. during the years of dearth.....When greater plenty prevailed they fell. In the country they were about a third less than in London."[4] Spinners were better paid, getting 24s. to 26s. a week from 1808 to 1815. Weavers, on the other hand, were miserably off, their wages falling from 13s. 10d. a week in 1802, when wheat cost only 67s. 9d. a quarter, to 4s. 3½d. in 1817, when it stood at 94s.[5] The introduction of machinery, leading as it did to the employment of women and children in the factories, is responsible for this decline. It also had the effect, in some instances, of throwing great numbers out of work altogether. Thus in 1811–12 a particular frame for stocking-weaving came into use at Nottingham which enabled one man to do the work of many, throwing the superfluous hands out of employment. Their remedy was to break into houses and destroy the frames—a

reprehensible act of violence, but more excusable than the conduct of the landowning monopolists who at this time were excluding foreign corn in order to keep up their own rents. The legislature, however, thought differently, and passed a Bill punishing the frame-breakers with death. On this occasion Byron, who opposed the second reading, told the Lords that he had traversed the seat of war in the Peninsula, and had been in some of the most oppressed provinces of Turkey; but never under the most despotic of infidel governments had he beheld such squalid wretchedness as he had seen since his return in the very heart of a Christian country.[1]

What Byron saw was only a specimen of the distress that prevailed through all the manufacturing districts of Great Britain, usually accompanied by the destruction of machinery and even of mills. Other causes besides the substitution of mechanical power for human labour had concurred to bring it about. Since 1797 cash payments had been suspended, and inflated issues of paper, combined with the bad harvest of 1809, had resulted in a terrible commercial crisis by which great numbers of operatives were thrown out of employment. Another crisis followed in 1814, caused this time by a good harvest, which, thanks to the protectionist system, ruined the farmers and obliged more than a third of the country banks to stop payment. Manufacturers suffered in consequence, and the destruction of machinery recommenced.[2]

[2] Harriet Martineau, *History of England* (1800–1815), p. 398. (Bohn's ed.)

The immediate effect of peace with France was not to diminish but to aggravate the distress. Exhausted by a long war, the Continental countries could not pay for our goods in money, for they had none to spare, nor in their own goods, for these were kept out by our protective tariff. As a consequence, in 1816 our export trade had fallen sixteen per cent., and our import trade twenty per cent., from the level reached two years before. At the same time the value of the currency rose with the prospect of a return to cash payments, and the price of commodities rose with it, but to a considerably greater extent.[1] A bad harvest came to complete the catastrophe. In 1816 the price of wheat rose from 52s. to 103s. per quarter. Rioting, accompanied by depredation, incendiarism, and machine-breaking, prevailed all over the country. It seemed as if Napoleon, though fallen, had dragged down the conquering nation in a common ruin with himself.

We have now to consider how the Industrial Terror, which was an episode in the Industrial Revolution, modified public opinion during the first years of the Peace. But that is a subject which must be reserved for the following chapter.

## CHAPTER IV.

# THE LIBERAL ODYSSEY

WE have seen in the foregoing chapter how the great Napoleonic War was accompanied by a remarkable rally of Liberalism, and generally by a more hopeful and progressive tone in the leading circles of opinion. Unfortunately, that forward-looking movement received a sudden check from the economic evils which war had brought in its train. The great reaction against liberal thought of every kind commonly associated with Burke's attack on the French Revolution did not really set in with full virulence until the years following Waterloo, when all danger from France was over. In the early nineties it had been made clear enough that the English people were fairly satisfied with the Government under which they lived, and certainly had no wish to imitate the behaviour of their neighbours across the Channel. Canning's *Knife-grinder,* if it meant anything at all, meant that the poor had no political or social grievances. Pitt became unpopular not because of his repressive measures, but because of the war. The war itself became popular when it was waged to protect England from invasion or to deliver Spain from oppression. The old King grew in his subjects' affection, and the people were content to be guided by his opinion on the Catholic claims.[1]

[1] Ward, *Letters to Ivy,* p. 85.

Now, it happened that the disappearance of George III. from the political scene in 1810 nearly coincided with the beginning of that widespread distress and discontent which the war at first obscured or palliated, but which the restoration of peace brought into full relief. Royal authority passed from the most honoured and steadfast of English sovereigns to the one who as Regent and King made the royal office more despicable and more despised than it had been made by any of his predecessors since Edward II. Tories might affect an enthusiastic loyalty for the hereditary representative of the Plantagenets and Tudors; but they must have felt that one who exhibited the vices of Louis XV. without his ability, and the vacillating incompetence of Louis XVI. without his respectability, was hardly a chief round whom they could rally with much confidence of success.

The interests symbolised by this degraded dandy were diversified, enormous, and in extreme peril. Capitalism, whether agricultural or manufacturing, was directly threatened by mob-violence, and indirectly threatened by the agitation for Parliamentary Reform. Those who advocated a large addition to the popular element in the House of Commons made no secret of their intention to use it as leverage for abolishing the protective tariff which mill-owners and landlords alike regarded as necessary to their existence. What was at least equally serious, the fundholders were threatened with the loss in whole or part of the interest on their investments. It was argued, not without some slight show of reason, that most of the war loans had been contracted in a depreciated paper

currency, and that therefore to pay the interest in gold would be robbing the poor to make the rich still richer. A reduction of twenty per cent. or so on the dividends was freely discussed; and to make up for the contemplated cutting-down of taxes all round it seemed not unlikely that a reformed Parliament would sponge out the debt altogether.

It has been already mentioned that Bentham, probably under the influence of James Mill, had by this time gone over to the democratic side, accepting even the extreme proposal of universal suffrage. Law reform had always been the object nearest to the heart of the old philosopher himself, and it had been adopted as a standing article in the programme of his followers. Now his contemplated reforms avowedly struck at the profits of the legal profession, and so far were likely to throw the whole of that influential body, conservative enough by nature, into the ranks of the Tory party. No professional interest (except the hangman's) was directly touched by Romilly's endeavours to reduce the number of capital offences; but none who trembled for the security of their property could view without alarm proposals calculated to diminish the penalties by which it was safeguarded.

Of all corporations the Anglican clergy, with the Bishops and the Universities at their head, were by training and association the most uncompromising enemies of progress, the most disposed to identify innovation of any kind with the extreme of revolutionary Radicalism. Their privileged position in the State was endangered by the Catholic and Dissenting claims, their tithes by free trade in corn, their Catechism by unsectarian education,

their infallible Bible by the advance of science, and all these collectively by whatever was involved in Parliamentary Reform.

These general motives for resistance were strengthened by the presence within the Church of gross abuses upheld by a powerful though small body of opinion, while those who suffered by them, though many, were weak and disunited. As an illustration of the length to which obstruction could be carried on such points, it may be mentioned that when Perceval, a Tory of the Tories, and personally most clerical, proposed in 1808 a measure compelling absentee pluralists to provide resident curates at a moderate salary for their neglected benefices, his Bill was opposed by the whole bench of Bishops, and rejected on the third reading without a division by the House of Lords. It was carried in 1813 by Lord Harrowby, a Liberal Peer, "amid the suppressed murmurs of the holders of Church property,"[1] but not without leaving a presumption of what might be expected from them in the coming conflict.

Finally, a much more limited but not insignificant contribution to Tory opinion came from the West Indian planters. With the success of the agitation for the abolition of the slave trade in 1807, Wilberforce and his friends turned their efforts against slavery itself, which before that had been carefully left out of the campaign. And the planters could point to this rise in the demands of their assailants as a warning example of what might follow on a first concession to Jacobinical attacks on the

[1] Walpole, *Life of Spencer Perceval,* vol. i., pp. 286–87.

rights of property in the name of the rights of man.

This coalition of prejudice and panic put an end for many years to the Liberal influences which had more or less asserted themselves in the Cabinet or in Parliament after Pitt's death. Power steadily gravitated to the most reactionary members of the Tory party. In 1810 the struggle for the Premiership between Canning and Perceval was decided in Perceval's favour, his rival quitting the Government and not returning to office until 1816, when he rejoined it to defend the policy of repression. The Marquess Wellesley resigned in 1812, and remained in opposition as a pro-Catholic and Free Trader for nearly ten years. Huskisson, the future Free Trader, gave his support in 1815 to extreme Protectionist legislation. After Perceval's death the leading spirits in the Regent's Government were Liverpool, Eldon, Castlereagh, and Sidmouth. All four opposed Catholic Emancipation, at that time the irreducible minimum of concession to Liberal principles—Castlereagh on grounds of expediency, his colleagues on grounds of sincere conviction. Liverpool was an average stolid Tory, distinguished only for his unrivalled power of keeping in office. Eldon, the Lord Chancellor, was Conservatism itself personified; he hated innovation as such and resisted it at all points, defending not only every political abuse, but even the atrocities of the English criminal law. The Court of Chancery is largely indebted for its evil reputation to the dilatoriness with which he allowed enormous arrears of business to accumulate during his tenure of office. As a statesman Castlereagh was the ablest and best of the four. His

administration of the war during its last years proved highly efficient; and at a critical moment he held together the European coalition against Napoleon when everything depended on its stability. After the peace he became the most unpopular member of the Government, chiefly because as Leader of the House of Commons he had to defend its policy of repression and of resistance to Reform. In reality, so far as any single individual deserved to be made responsible for the state of the country, Sidmouth was that one. This pompous mediocrity is best known to history as the Addington who replaced Pitt in the confidence of George III. when the understanding on which the union with Ireland was carried had to be violated, that the royal conscience might be relieved at the expense of the nation's honour and safety. Raised to the peerage under the title of Viscount Sidmouth, the same inglorious leader contrived to make his way into every subsequent Cabinet but one, until he became Home Secretary in 1812, continuing in that office for the next ten years. His administration is marked by riot and conspiracy on the one side, repression and bloodshed on the other. In 1819 a large open-air meeting held in St. Peter's Fields, near Manchester, to petition for Parliamentary Reform, was attacked by mounted yeomanry and dispersed with some loss of life. At about the same time a batch of coercive measures known as the Six Acts were passed, some of them legitimate enough, but others having for their sole object to put down all adverse criticism of the Government at public meetings or in the Press. Twenty years before, Portland's administration

of the Home Office had preserved order without anything like the same ferocity. It must be owned that some of the Whig leaders supported Sidmouth's coercive measures; but they were not responsible for the policy that made force the only remedy for discontent.

The weakest, or at any rate the most assailable point in the Tory position was, as I have said, the character of the Regent, whose vices did the cause of free representation as much good as the virtues of his father had done it harm. For a time the popularity of his daughter and heiress, the Princess Charlotte, screened him and his office from attack; with her death the last hope of the English Monarchy seemed to expire, leaving it a prey to internecine strife. For if the Regent's daughter was dead, his wife, the unfortunate Caroline of Brunswick, Princess of Wales, still lived, serving the Opposition as a pawn with which to hold the future King in check for the present, and to push up to queen for his destruction at an opportune crisis of the game. So long as the Whigs counted on his favour she had been a Tory heroine; after he deserted them she passed to their side. When the Continent was reopened to English travellers, the Princess, a born Bohemian, took the opportunity of going abroad, and wandered about in very compromising company, watched everywhere by her husband's spies. On the death of George III., by Brougham's orders,[1] she at once returned to England, claiming

[1] This has recently been placed beyond all doubt by the publication of a private letter from Brougham to Creevey. (*Creevey Papers*, vol. i., p. 297.)

to be officially recognised as Queen. On landing she found herself the heroine of the Reform party and of the people. Her journey from Dover to London was a triumphal progress. The King and his Ministers met the attack by laying before the House of Lords a Bill to dissolve his marriage and to deprive the Queen of her title, evidence of her alleged misconduct being supplied in justification of the measure. For several weeks the country was deluged with filth. A general impression prevailed that the King was morally though not legally debarred by his own profligacy from seeking to divorce a wife who on the least merciful view had been much less guilty than himself. The Bill passed its third reading in the Lords by a small majority; then it was dropped amid the rejoicings of the people. How little they cared for her personally, how entirely their jubilation was meant as an expression of passionate hostility to the King, appeared soon afterwards, when her frantic efforts to be present at his coronation were met with indifference by some and with insult by others in the vast multitude assembled round the approaches to Westminster Abbey. A few days after the ceremony Caroline died broken-hearted, but the work for which Brougham had used her was accomplished. The personal power of the monarch had received a mortal blow, although it still lingered for several years in the agonies of dissolution, with influence enough to prevent the formation of a united and powerful executive.

Great events do not spring from trifling causes; but these really do determine what after all is a trifling circumstance in great events, that is the

precise moment of their occurrence. What people called the Queen's Trial was such a trifling event. By it we can date with precision the beginning of a new era, just as by the divorce of Catherine of Arragon we can date with precision the beginning of the English Reformation. Brougham, ablest and most energetic of the first Edinburgh Reviewers, and since 1815 a Parliamentary power of the first order, attained the zenith of popularity by his defence of the Queen before the House of Lords. This position made him a sort of link between the Radicals, with whom he had become disgusted, and the kid-glove Whigs of Holland House, who held scornfully aloof from the dirty work of agitation. On the other hand, the Ministry was weakened to an equal extent by the secession of Canning. This had been postponed till after the withdrawal of the Divorce Bill, but was understood to be connected with an attachment of old standing for the Queen, which made him unwilling to share in the responsibility for her persecution. How great was the loss is shown by the fact that his eloquence had just before this induced the House to reject a motion of Brougham's tending to abridge the power of the Crown by a rearrangement of the King's Civil List.[1] Next year the weakened and divided Ministry had to accept an important economical reform proposed by Joseph Hume, a disciple of Bentham, and largely to reduce the expenditure in deference to the demand of the people.

Under the terrible stress of the Tory reaction

[1] Walpole, vol. ii., pp. 88–89.

Whitbread and Romilly had committed suicide, Francis Horner died young, Ponsonby not indeed young, but prematurely. It was now the turn of those in power to succumb. Within little more than a twelvemonth Liverpool temporarily withdrew from public life, disabled by a domestic calamity, Sidmouth wearily surrendered the Home Office, and Castlereagh, now Marquess of Londonderry, died by his own hand. These things were not accidents, but incidents of strife, almost of civil war.

The triumph of titled obstruction was over, and untitled reformers made their way into the seats of power. Canning became Foreign Minister, forced on the reluctant King by public opinion; and in returning to office he also returned to the Liberal principles of his youth. Robert Peel, who had already begun to accept the guidance of public opinion, took Sidmouth's place as Home Secretary. Huskisson was not indeed made what he ought to have been, Chancellor of the Exchequer, the incompetent Vansittart being relieved in that exalted position by the somewhat less incompetent Robinson; but as President of the Board of Trade he directed the financial policy of England and initiated those great Free Trade measures which were to restore the prosperity she had lost. Eldon still unhappily remained Chancellor, to the ruin of his broken-hearted suitors; but it was beyond his power to arrest the progress of Criminal Law Reform. This had been long and unsuccessfully advocated by Romilly, a disciple of Bentham. After his death Mackintosh took up the work and

scored a first victory over the Government in 1819. Next year he persuaded Parliament to repeal the death-penalty for private stealing in shops.[1] In 1823 he proposed a more comprehensive scheme of reform, but was induced to surrender it into the hands of Peel, by whom much of it was carried out during his tenure of the Home Office. In the same year Peel also put an end to the depreciated paper currency, which Cobbett, the chief Radical journalist, had long denounced. In 1824 the Combination Laws making strikes penal were repealed.

Still the true chief of the remodelled Government and its most magnetic figure was not Peel, but he whom Heine has called the great, the noble, the adored Canning,[2] a phrase which, coming from such a writer, proves Canning to have been also the acknowledged leader of European Liberalism. His name brings us back to that world-wide movement by which the French Revolution, after its perversion and degradation under Napoleon, after its apparent overthrow by the allied Sovereigns, resumed its chequered course in a series of conflicts whose final outcome is not yet decided.

We have seen how French aggressions on the independence of other nationalities first alienated English Liberal opinion from the Revolutionary cause, and ultimately brought the English reactionaries themselves to become champions of liberty, not only in the Iberian Peninsula, but all over

Europe. It now remains to add that the peoples were induced to join their hereditary Sovereigns in the final revolt against Napoleon by an understanding that the recovery of independence from a foreign power would be followed by the concession of constitutional liberty at home. That understanding was violated, and the restored Governments had nothing more pressing than to reinstate, so far as they could, the old system of privilege and superstition, entering even into a compact, known as the Holy Alliance, for mutual assistance in repressing their subjects' revolutionary aspirations. With this compact the English Cabinet had nothing to do, although Castlereagh was accused, wrongly as would seem, of giving it a moral support. Still, the unjust treatment of Ireland, to which he had made himself a party, and his coercive rule at home, placed him in line with the Continental despots. Had he lived to attend the Congress of Verona, it is possible that public opinion might have assigned him a very different position—the position actually won by his successor, Canning.

Years before Napoleon's fall a movement destined to represent, and represent alone, the revolutionary cause during the first period of legitimist reaction, had begun to take shape in the Western hemisphere. The French conquest of Spain gave the Spanish colonies in America a long-desired opportunity for asserting their independence; and by the time that the French armies had cleared out of Spain her dominion in the New World was practically at an end. Nevertheless, the conflict, which was fought out with far more heroism than that between England and her Colonies, continued

to rage for many years, furnishing a new field for their energies to great numbers of English soldiers and sailors whom the peace had thrown out of work, and promising to furnish English manufacturers with new markets for their wares when the Spanish monopoly should have been definitely abolished.

At length the sword of oppression turned against its own heart. The armies assembled in the Spanish sea-ports for the re-conquest of America mutinied and declared for constitutional government. The movement spread with electric rapidity all over the country, and in a few weeks King Ferdinand swore fidelity to the Constitution of 1812. Naples followed suit immediately, and another Ferdinand went through the same comedy as his cousin at Madrid. In Portugal the tyrannical regency was deposed and a representative assembly convened. Next year an abortive insurrectionary movement broke out in Roumania, followed by a more hopeful Greek rising in the Peloponnesus and the Ægean islands.

Reaction followed close on the heels of Revolution. Before Greece had taken fire an Austrian army entered Naples and reinstated the perjurèd King in the authority he had so abused. Turkish vengeance was even more prompt and terrible. Four Greek Archbishops were hanged on the Easter Day of the same year. Then followed a series of massacres, among the worst of those by which Ottoman dominion is periodically signalised, culminating in the awful devastation of Chios, where 70,000 Greeks were either slaughtered or sold into slavery during the spring of 1822.

Russia, so far from protecting the Greek Christians, left them to their fate, and occupied herself with putting down liberty elsewhere. For this purpose the Czar was preparing to send his Cossacks into Spain, when France intervened and overthrew the new Constitution by force of arms. Among the victims of absolutist vengeance was Diaz, the William Wallace of Spain, justly famed under the name of the Empecinado for the part he had played as a guerilla chief in the War of Independence against Napoleon.

At the first outbreak of the European Revolution a Congress of the great Powers assembled at Verona (1822) to deliberate on the situation. Wellington represented England. He did not love popular government; but neither, probably, did he like to see the country he had freed from French vassalage brought again under the same yoke by Napoleon's puny successor. Canning, who had begun the Peninsular War, and who was an enthusiast for national independence, hated to see England's most glorious work undone. But he could not stop France, who this time had the armed force of the Continent at her back. Two things, however, he could do: he could protect America from the same sort of treatment, and he could also protect Portugal. At the Congress of Aix-la-Chapelle in 1818 the Czar had proposed that the fleets of Europe should be sent to crush Republicanism in South America. Castlereagh raised no objection, but declined on England's behalf to join in the work. In 1823 a well-founded impression prevailed that France, either singly or with her allies, designed to follow up the conquest of Spain by a naval expedition for the reduction of

her American colonies; with a prospect of indemnifying herself by territorial acquisitions for the expenses of the war. Canning intimated that England would not tolerate such an enterprise; and as he disposed of a fleet superior to all the fleets of the world put together, his remonstrances were listened to with respect. Much to the disgust of the Powers, he also recognised the South American Republics, and gave an additional safeguard to their independence by suggesting to the President of the United States what is still known as the Monroe Doctrine—that is, the principle that no European State may acquire new territory on the American Continent or interfere in the domestic concerns of any American community.

Canning's next move was made in defence of Portugal. Don Miguel, the absolutist heir to the Portuguese throne, had conspired against the Cortes, and levied troops to destroy the new Constitution. He was driven into exile; but his army retired to the other side of the Spanish frontier, and, under the protection of the restored Spanish monarchy, waged war against the liberties of their country. Acting under a treaty that obliged England to defend her old ally against foreign attack, Canning sent troops to Lisbon. Secured by their presence, the Liberal Portuguese Regency drove Don Miguel's forces back into Spain, where the reactionary government now saw itself obliged to disown and disband them.

However, neither South America nor Portugal were interesting enough in themselves to command the undivided enthusiasm of Liberal opinion. That could only be awakened by the cause of Greece. Here the influence of literature acted

more powerfully than political oratory or journalism to enlist the sympathies of Englishmen. Members of the governing aristocracy had not forgotten their classical education. "We are all Greeks!" exclaimed Shelley. Byron succeeded best when he struck this chord of sympathy in the Second Canto of *Childe Harold,* in the *Giaour,* and in the *Corsair.* True, the same qualities that endeared the Chosen People of Culture to these two young poets were regarded with some dread and suspicion by politicians of the opposite school. The best Greek history then existing, Mitford's, published between 1784 and 1810, is, as Mill observes, "penetrated with the anti-Jacobin spirit in every line," and the *Quarterly Review* "laboured as diligently for many years to vilify the Athenian republic as the American."[1] But, on the other hand, quite apart from classic traditions, much in the Greek cause appealed to the romanticism generally associated with reactionary political opinions. Elsewhere the revolutionary cause was, truly or not, represented by its enemies as an anti-Christian crusade. In Greece it stood for Christianity; and Shelley, himself an unbeliever, in the Preface to his *Hellas,* unhesitatingly denounces the Turks as the enemies of Christianity, while in a chorus of the drama itself he contrasts the immortal cross of Christ with the dying moon of Mahomet. It is not wonderful, then, that the last of France's most Christian Kings "manifested on behalf of the suffering Christians of Greece a chivalrous warmth of heart, a gallantry, and a generosity which did honour to his character."[2]

In Byron's poetry the classic and romantic currents are so perfectly fused together that none can tell what share each element contributed to the genius which reaches its highest expression in *The Isles of Greece.* His, therefore, was the decisive word; his, even more, the decisive deed. No poet's personality had ever counted for so much as an element in his literary success, and that even when it was understood to be the personality of a reckless and faithless voluptuary. How incalculable, then, must have been its effect on public opinion when Byron came forward no longer as the sentimental singer of Greek woes, but as an armed soldier in the war for Greek independence! His life, had it been prolonged, would have done less for European emancipation than his death; death on the field would have been less effective than death from exposure and fever; for that, so uncoveted, made the heroism of his self-devotion more apparent.

Canning had a much harder part to play than Byron's, and he fell in the war of opinion by a more tragic fate, bequeathing ruin to his party and victory to his two great rivals, Peel and Earl Grey; but victory also to principles he held more dear than any party distinctions. His sympathies were with Greece, and what in the circumstances could be done to save her he did, although now it seems little enough. Then, as half a century later, the problem was to use Russia as an instrument for coercing the Porte, without at the same time allowing the Czar to seize Constantinople, with the chance of kindling a European war. Just before his death Canning, with the help of France, had nearly solved the problem; and, although the

decisive battle of Navarino, which he did not live to see, may have gone beyond his intentions, it was no more than the natural result of his policy. A still more momentous result was the breaking-up of the Holy Alliance, the isolation of the German Powers, and the definite enrolment of France among the friends of European liberty.

On Liverpool's retirement in 1827, Canning, who had long been the ruling spirit of the Cabinet, became, in name as well as in fact, Prime Minister of England. His advent to the supreme dignity marked another step in Liberalism, for it involved the transfer of office from Tories to Whigs on a considerable scale, besides securing the independent support of some Whigs who did not take office.

The party shibboleth at that time was Catholic Emancipation. Canning renounced the support of his ablest colleagues because they opposed it; he accepted the co-operation of former opponents because they supported it, and this notwithstanding the King's known objection to Emancipation. It seems, therefore, certain that, had the Prime Minister lived, it would have formed a part of his legislative programme. Nevertheless, there is reason to believe that the great popular chief, although in this instance he represented the most enlightened opinion of the country, and although the Radicals, no less than the Whigs, were with him, did not represent the opinion of the masses. To understand how this came about we must go a little further back.

The Catholic question, when it first arose, did

not particularly interest the English people. Had George III. agreed with Pitt, they would have tolerated the presence of some fifty Irish Catholic gentlemen and of a few English Catholic peers in Parliament; but, as George III. did not agree, they thought he should have his own way even at the expense of losing their trusted pilot before he had brought the ship of State into port. At the general election of 1807, following immediately after the King had dismissed his Ministers because they proposed to admit Catholic officers to high commands in the army and navy, some of the leading Whigs lost their seats because they had opposed his Majesty's wishes. A shrewd observer, himself a Liberal, remarked at the time that "as long as the King is anti-Catholic the people will be so too."[1] A few years later royal authority passed to the Regent, and in 1812 Emancipation seemed in sight; but personal difficulties prevented the formation of a Whig Administration, and, unhappily for the peace of Ireland, the moment for generous concession passed by, never to return.

With the end of the war English opinion took a turn most unfavourable to religious justice. For, until Napoleon fell, various Biblical prophecies, formerly supposed to be predictions of the Papal power, had been interpreted as referring to his career. He was the little horn in Daniel, or he was Antichrist. After Waterloo, Protestant theology reverted to the old exegesis. Besides, the claim to personal infallibility as Head of the Church, now put forward more audaciously than

[1] Ward, *Letters to Ivy*, p. 85.

ever on the Pope's behalf, produced an unreasonable, but not unnatural, irritation among those who disowned his authority altogether. We can therefore understand why, when Canning accepted office in 1816, "the opinions of the great mass of the population in England had become, more than they had been, hostile to Emancipation."[1]

No progress was made until the beginning of the great Liberal movement in 1821. At that date the unreformed House was probably more enlightened than the people. At any rate, it passed a Catholic Relief Bill by a majority of 19.[2] This was rejected in the Lords by a majority of 39, with the heir presumptive to the throne at its head. Then Canning passed a Bill through the Commons admitting, as an experiment, Catholic peers to sit in the Upper House; but the Lords rejected this also by a majority of 42. In two subsequent sessions the conflict of opinion between the Houses was repeated, once before and once after Canning's death. As usual it was settled by that *ultima ratio populorum,* the threat of an appeal to physical force. A great demagogue, Daniel O'Connell, had so united and organised the Irish demand for justice that its voice spoke with irresistible effect to an English Legislature divided against itself. After refusing to accept Canning's policy during his life, Peel and Wellington were obliged to put it into execution as his heirs, under the form of a humiliating submission to violence.

Yet, at the cost of civil war, force might have

been met by force. Wellington declared that, by resisting Emancipation, he might have made himself the most popular of Ministers; and during the progress of the measure through Parliament innumerable petitions against it poured in to the King.[1] As has been already mentioned, this anti-Catholic feeling went back to the end of the war, being in fact the outcome of a wider and older movement. Besides starting a number of new sects, Methodism had given new life to the religious communities already in existence. From his accession George III. had been noted for personal piety, although his example does not seem to have influenced Court or official circles. The first religious minister of whom we hear is Perceval, much occupied with Church questions, and no less regular in his attendance at public worship than Pitt had been in his absence from it. Still more punctilious was Wilberforce, who called Perceval's attention to the danger of convoking Parliament for a Monday, whereby gentlemen who lived at a distance from London might be tempted into Sunday travelling.[2] Reaction in religion went hand in hand with reaction in politics. Southey became at once a Tory and a High Churchman. Wordsworth remained true to his early sympathies for a much longer period, but definitely enrolled himself on the same side as his friend and neighbour after the Peace—driven to it probably by the rising storm of discontent among the poor. In 1821 he wrote, *invitâ Minervâ,* a long series of

Ecclesiastical Sonnets, strongly anti-Papal, and directed towards the glorification of the Anglican Church on its Protestant side. In 1816 and 1817 Coleridge published two "Lay Sermons," proposing to remedy the evils affecting England by a mystical interpretation of the Bible (in whose inspiration, by the way, he at no time believed) and glorifying Perceval as "the best and wisest statesman this country has possessed since the Revolution."[1] All three poets were passionately opposed to Emancipation, Wordsworth in particular prophesying that Catholic members of Parliament would co-operate with "other dissenters and infidels" in pulling down the Church of England.[2] They probably would have resisted the grant of a million for building new churches, voted in 1818 at a time of great financial distress, and the further grant of half a million for the same purpose voted in 1824, of which we hear that it was "not popular in the country."[3]

Coleridge, in his first Lay Sermon, cautiously deprecates the interpretation of Scripture prophecies as miraculous predictions of events in modern history. But for the mass of uneducated British Protestants they had no other meaning and no other interest. The nervous strain set up by the great war continued after its close, and bred a diseased craving for new sources of excitement. These were supplied to some extent by the pietistic movement; but intense religious feeling needs to be discharged along lines of greater activity than Bible-readings

and prayer-meetings can supply. Some threw themselves into an agitation for the abolition of West Indian slavery. Others started missions for the conversion of Mohammedans and heathens to Christianity, or for the conversion of Irish and Continental Papists to what they were pleased to call the Gospel. Now that Southern Europe lay open to proselytism no more seemed needed for its regeneration than the gratuitous and wholesale distribution of Bibles and Testaments among the benighted inhabitants. But there were more sanguine and enthusiastic spirits whom even the prospect of a new Reformation could not content. These looked forward with a fearful joy to some great catastrophe heralding the Second Advent and the end of the world. They soon found a preacher to their mind in the person of a tall, handsome, and eloquent young Scotchman named Edward Irving, now best known as the early friend of Jane Welsh and Thomas Carlyle. In 1822 Irving came up to London, and soon attracted crowds to the chapel where his oratorical gifts were first displayed. Canning paid his preaching a high compliment in the House of Commons; and the fashionable world flocked to hear his impassioned proclamation of judgment to come. In 1827 he moved to a larger church, where audiences of a thousand persons hung spell-bound on his lips. That date marks the climax of his career as an index of popular religious feeling in England. Subsequently his name becomes associated with struggles and delusions which do not concern us here. Let it suffice to mention that, even so late as the close of 1831, millenarian enthusiasm still prevailed to

such an extent that anyone who doubted the near approach of the Second Advent was denounced by the majority of religious persons as an infidel,[1] even the enlightened Dr. Arnold of Rugby holding that a terrible catastrophe of some sort might be soon expected.[2]

Side by side with these noisy manifestations of reactionary mysticism a counter-current of steadier and more voluminous energy had set in. The progress of English Rationalism seemed to have been long arrested, but in reality it had been working underground, giving even such occasional evidences of continued activity as Gibbon's Roman History for scholarship and Paine's *Age of Reason* for popularity. Like the religious revival, it gained new prominence with the Peace. We have seen how, long before the end of the war, education had become a foremost interest in English life, and had at once connected itself with religious controversy. Lancaster went for simple Bible-teaching, Bell for Church control and the Catechism. Bentham took up their method of mutual instruction, and made it the basis of an elaborate educational system which he proposed at once to put into practice in a sort of college to be built on his own grounds. The religious difficulty was to be got rid of by eliminating religion altogether from the proposed curriculum. Various titled and wealthy persons promised their support, but withdrew it on finding that the secular scheme was denounced as dangerous by the clergy. Bentham retorted by an unsparing criticism of the Church Catechism, an attack on the personal

character of St. Paul, and an *Analysis of Natural Religion,* written in collaboration with George Grote, the future historian of Greece. The object of this last work is to prove that the belief in God and a future life is most pernicious to human happiness, both by its direct effect in exciting terror, and indirectly by leading to the domination of an anti-social priestly class.

Although Bentham's scheme of secular education had at first no success, it remained a fundamental principle with his followers, and was realised, if only to a very limited extent, by the establishment of University College, London. The idea of that institution first came from the poet Campbell, a staunch Liberal, and was promptly taken up by the Benthamites, who, in association with other independent thinkers, raised £160,000 for the endowment of a college, opened in 1828, from whose curriculum religious instruction was omitted, and for the tenure of whose chairs no theological qualification was required.[1]

However, the main stream of opposition to religious orthodoxy was not represented by Bentham's school with its anonymous publications, but by the older Radicalism, whose most popular exponent was William Cobbett. Like Bentham, this powerful journalist had begun as an enemy of democracy, but, like him, had come to think that electoral reform supplied the only remedy for bad government. Imprisoned and heavily fined for showing up a cruel case of flogging in the army during the war, he became after the Peace the most widely

read advocate of retrenchment, Free Trade, full representation of the people, and Catholic Emancipation, always basing his views on thoroughly practical considerations and on a profound study of English history. Driven out of the country by Sidmouth's repressive Acts, he took refuge in America. On a former visit to the United States he had attacked Priestley as a "Unitarian infidel," and helped to circulate slanderous stories about Paine. It may be gathered from his sneers at dissent and deism that Cobbett was at that time a good Churchman. Agreement with Paine's views on paper currency led him to form a juster estimate of the democratic freethinker's moral character. Paine died at New York in 1809, and a story gained credence that he had recanted on his deathbed. Cobbett proved by cross-examining the witnesses that no such recantation had been made. What was more he dug up Paine's bones, and carried them with him on his return to England in 1819, prophesying that these relics would effect a reformation in Church and State.[1]

Much ridicule has been cast on Cobbett's proceedings by people who would see nothing to laugh at or deplore in the second funeral of Napoleon, the transfer of whose body from St. Helena to Paris led on to the despotism and superstition of the Second Empire. At any rate, the arrival of Paine's bones in England coincides with a great revival of interest in his writings and the beginning of a sharp struggle between liberty of religious opinion and authority, in which liberty finally won.

The Regency, although a period of political reaction and reviving bigotry, was not on the whole, till near its end, a period of persecution. In 1812 Eaton, a bookseller, was prosecuted for selling the *Age of Reason,* and sentenced by Lord Ellenborough to be imprisoned for eighteen months and to stand for an hour in the pillory. He "underwent his public punishment amid the waving of hats and cheering of the crowd, not a voice or arm being raised against him."[1] At the end of 1817 another bookseller, William Hone, was prosecuted and underwent three distinct trials, the second and third also before Lord Ellenborough, for publishing certain alleged blasphemous parodies on the Litany, the Creed, the Lord's Prayer, and the Ten Commandments. Notwithstanding the violent efforts of his judges to procure a condemnation, Hone succeeded in persuading the jury that his sole object had been to throw ridicule on political abuses, and on each occasion he was acquitted.

Such a plea as Hone's could not be raised by Richard Carlile. This remarkable man edited and sold, among other books of a similar character, Paine's theological writings. After a three days' trial he was sentenced to a fine of £1,500 and eighteen months' imprisonment—a term extended to six years from his inability to pay the fine. The shopmen who sold his books all that time were also seized and imprisoned—the places of the victims being filled up immediately by eager volunteers—until recourse was had to a machine by which the volume asked for was given out and

[1] Dowden, *Life of Shelley,* vol. i., p. 289.

payment for it received without the vendor's face being seen by the purchaser. Large sums were raised for Carlile's benefit during his imprisonment, and on his release he found an establishment provided for him in Fleet Street, where the incriminated works were henceforth sold with impunity.

From Dorchester Gaol Carlile issued an *Address to Men of Science, calling upon them to stand forward and vindicate the Truth.* In this pamphlet he mentions the case of Professor (afterwards Sir) William Lawrence, who, according to him, was deprived of his post at the College of Surgeons for having attacked the prevalent religious beliefs in his lectures.[1] But Lawrence was an exception. Men of science under the reactionary *régime* had fallen off considerably from the standard of Priestley and Erasmus Darwin; so much so, indeed, that their most brilliant living representative, Sir H. Davy, joined the obscurantists in denouncing the new science of geology as dangerous to revealed religion, to the disgust even of Coleridge, who called the German Biblical critics infidels, while privately supporting their views.

Coleridge, in fact, contributed largely to what was now becoming a chief factor in progressive English thought—that is, renewed intercourse with the Continent. It has been seen what a powerful stimulus was given to English science and literature in the previous generation by the French Revolution and by German Romanticism. That impulse continued to operate, although with somewhat abated energy, all through the Napoleonic

[1] Carlile, *An Address, etc.*, London, 1821, p. 19.

war; with the Peace it came up again in a greatly generalised form, especially after England, under Canning's guidance, made herself the champion of popular government all over the world. English travellers dispersed themselves through every country; English readers ransacked the history and literature of all times. We find a reflex of that boundless curiosity more especially in the souls of two poetesses—in the metrical essays of Felicia Hemans, in the youthful studies of Elizabeth Barrett. It was nourished by the still fresher enthusiasm of American tourists, and returned on Britain herself by the candid admiration of foreign critics for the words and works of this victorious island at the epochs not only of its present but of its former glory.

Italy had long been a favourite haunt of English travellers. But in the eighteenth century it had been more a land of curios and connoisseurs; now it was the home of great traditions and exalted hopes, framed in scenes of corresponding magnificence. There Byron and Shelley first found their true selves, found in that environment their poetic genius doubled at a stroke. Under their lead English poetry first fully rose from a realism often petty, always didactic, to the supreme heights of true romance; but a romance definitely dissociated from superstition and reaction, linked as in the Greek War of Independence with the classical traditions of reason, self-government, and freedom. Byron had already given the signal for that alliance in the first cantos of *Childe Harold;* he confirmed it by the inspiration of Ravenna and the example of Missolonghi.

In Keats the spirit of Hellenism, considered as the kingdom of man wedded to nature, reigns without a rival. Probably he was indebted to Byron for an emancipation so complete that no trace of a struggle with supernaturalist beliefs has been left in his works. Yet, so far as Shelley and Keats follow any poetic tradition, the predecessor with whom they can best be connected is not Byron, but Southey. In *Queen Mab* the formal imitation of *Thalaba* is quite obvious; and the influence of Southey's general method and style still prevails through *Alastor,* the *Revolt of Islam,* and *Prometheus Unbound.* With Keats the dependence becomes much less visible; still the idea of choosing vast mythological subjects for poetic treatment would hardly have occurred to him, even after Spenser's example, had not the Laureate led the way in his now forgotten epics.

It is remarkable to what an extent the great literary productivity of the Regency seems connected with the diversion into poetry and fiction of genius, which in other circumstances might have been applied to practical life. Scott had in him the making of a soldier-statesman like Wellington; within the limitations assigned by fate to his ambition, he cared chiefly for making himself a great landed proprietor. Byron, never a true literary artist, might well have become another Fox; indeed, the impression made on Brougham, who cut up his juvenile verses in the *Edinburgh,* was that the young lord "had better give up poetry and apply his talents, which were considerable, to better account." At Oxford Shelley devoted himself to physical science, and, after his expulsion,

to political agitation; while his tragic death was connected with a very businesslike scheme for establishing steam-communication between Genoa and Leghorn. Keats "impressed all his schoolfellows with a conviction of his future greatness, 'but rather in a military or some such active sphere of life than in the peaceful arena of literature.'"[1] Finally Landor, who for convenience may be included in the list, is called by De Quincey "a spirit built by nature to animate a leader in storms, a martyr, a national reformer, an arch-rebel, whom the accidents of education have turned into a contemplative recluse."[2]

There seems, then, some reason for connecting the literary splendour of the Regency and the first years of George IV. with the political stagnation and general reactionariness of the period. So long as the old King remained in power there were hopes that his successor would inaugurate a more Liberal system. The Regent's Ministers were more opposed to all reform than his father's had been, and the victory over Napoleon seemed to give Toryism a new lease of life. Then the progressists transferred their allegiance to the Princess Charlotte, and with her death in 1817 all hope expired. But Liberty, that "eternal spirit of the chainless mind," is, as Byron sang, "brightest in dungeons"; and the ideals that replace her possession burn most intensely in the darkest night. English literature has produced few greater works than some that appeared from 1814 to 1822 (the year when Canning took the helm), more especially during the last five

[1] Lord Houghton, *Life and Letters of Keats*, pp. 5–6.

years of the period—that is, the quinquennium following the Princess Charlotte's death. Jane Austen, finding her pen once more, adds three other masterpieces to the three left so long unpublished. Scott writes the most and the best of his novels. Byron, Shelley, Keats produce all that puts them in the first rank of poets. Note also that the very best of Byron's and Shelley's work—the fourth Canto of *Childe Harold, Manfred, Cain,* the *Vision of Judgment,* and the first Cantos of *Don Juan,* of the one, the *Cenci* and the great lyrics of the other—belong to 1818–1822; as also do Keats's most perfect things. I may add that Coleridge's *Biographia Literaria,* containing his finest extant literary criticism, appeared in 1817; and that the most brilliant of Lamb's and Hazlitt's essays belong also to the first decade of the Peace.

Among those who form this galaxy of genius some were not revolutionists. Still it seems likely that for them also the stagnation and gloom of politics gave an unwonted interest and zest to pure literature, such as it never afterwards possessed.

It may be urged that, apart from any political revival, the tragic deaths of Keats, Shelley, and Byron, followed by Scott's no less tragic bankruptcy, sufficiently account for the rapid literary decline of the twenties. And this would be true were those catastrophes just what they are commonly held to be, so many deplorable accidents. But, except in the case of Keats, they are something more, they are the revenges of reality on genius estranged from its service. What has been said of the somewhat similar fatalities so numerous at this

time among the statesmen also applies in some degree to the poets, gifted as these were with the same pushing, speculative, experimental temper. All might have said of themselves, with the same confidence as Shelley, "I always go on until I am stopped, and I never am stopped."[1] They were stopped by something still more imperious than themselves—by the physical and social forces to which their wills were not adjusted.

With the disappearance of her great poets from the scene we reach a turning-point in the intellectual history of England which, both from its importance and from the wealth of material to be discussed, makes it advisable to begin a new chapter.

[1] "Hasty, peremptory, and intolerant of contradiction" is the character Scott gives of himself under the person of Colonel Mannering. (*Guy Mannering*, chap. xvii.)

## Chapter V.

## *DE REPUBLICA*

With the eclipse of imaginative idealism involved in the dawn of a new political system, English literature becomes possessed by another idealism of a more practical kind, fed on the lessons of history and directed towards the reformation of government. The names that first engage our attention belong to historians who were also politicians—Hallam, Macaulay, Carlyle. Let us glance at their respective attitudes towards the great interests of the age.

Hallam's *Constitutional History* maintains the old Whig point of view against both Tories and Radicals. Macaulay, then an advanced Liberal, in reviewing it, as before in his Essay on Milton, vindicates the revolutionary Cromwellian side, anticipating Carlyle by twenty years. Earlier still he had passionately defended Athenian democracy against Mitford, here equally anticipating Grote. He prophesies the honour that will be paid to Machiavelli in a liberated Italy. Shelley, whose genius he could scarcely have appreciated, is extolled in the Essay on Bunyan as potentially the greatest of modern poets, nominally for qualities of which he showed no trace, but really, we must suppose, from sympathy with his political and religious theories.

Carlyle had no aptitude for literary criticism, nor any love of artistic beauty for its own sake; as a judge of poetry he can compare even less than Macaulay with Coleridge, Lamb, and Hazlitt. Yet many of his best years were devoted to doing thoroughly what William Taylor had done imperfectly—to making German literature known in England. What he appreciated was, as Goethe observed, its intellectual and moral substance rather than its form; what one may call, using a more modern term, the application of ideas to life, the desire to remove obsolete institutions, combined with the fullest recognition of their value in past ages, and of the necessity for replacing them with something more solid than a simple negation. Whether Carlyle ever saw into the genial pedantry of German life, the systematic schooling and drill of it all, interspersed with so much frolicsome enjoyment, is not clear; but he did much to remove the prevalent English conception of the Germans, as mystical dreamers or romantic sentimentalists, inherited from the first revolutionary period.

Carlyle had convinced himself early in life that the religious beliefs of his countrymen were what he called superstition. But it would seem that his attitude in this respect owed nothing to German thought; it was determined by the tradition of eighteenth-century Rationalism, by reading Voltaire and Gibbon. If anything, Germany taught him to revere the religious beliefs of the past as symbols of an eternal, indefinable reality. Thus to the outer world he appeared as a mystic, only a few intimate friends being permitted to know what abysmal negations his cloudy phraseology

concealed. Coleridge held, at bottom, much the same views, but with an ever-increasing tendency to pass off the dogma and ritual of Anglicanism, which Carlyle hated and despised, as their adequate expression. On the other hand, he had made himself acquainted, when a young man at Göttingen, with some important results of German Biblical criticism most subversive of Anglican orthodoxy as then understood; and these he communicated to his friends in conversation, or jotted them down in the margins of his favourite English seventeenth-century divines.

Long before the great poet's opinions were made known, Herbert Marsh, afterwards Bishop of Peterborough, had translated the work of Michaelis, a Göttingen professor, on the Gospels, adopting, with some formal reservations, the principles of an exegesis really incompatible with the dogma of Scriptural infallibility. Napoleon's Continental blockade seems to have been more effective in keeping German ideas out of England than in keeping English goods out of Germany; but with the return of peace intellectual intercourse was resumed, and English students once more went to receive instruction at Göttingen from professors who had the recommendation of being fellow-subjects of King George. There the veteran rationalist Eichhorn still taught, and he gave them his opinion of some Biblical legends in language of unmistakable significance. In 1825 young Thirlwall, afterwards Bishop of St. David's, translated Schleiermacher's *Introduction to St. Luke,* with a Preface from his own pen implying that the inspiration of the Gospels, whatever else it meant,

certainly did not guarantee their historical accuracy.

Soon afterwards Thirlwall, with the co-operation of Julius Hare, the future Archdeacon, translated Niebuhr's Roman History; and at the same time Wolf's *Prolegomena to Homer,* another work of disintegrating criticism, began to attract the attention of English scholars. From their connection with such universally interesting subjects the researches of Niebuhr and Wolf were sure to command attention in this country; while their method of using popular ballad-poetry as a key to the origin of ancient history and literature brought them into living contact with the fashionable romanticism of the day.

The two great German critics were well aware that their methods might be applied with no less success to Hebrew tradition than to Homer and Livy; but they left the application to be made by others. An English poet and scholar, afterwards, as Dean Milman, the picturesque historian of Latin Christianity, without any intention of discrediting the early Biblical narratives, retold them, in what he called a *History of the Jews,* in a style of such rhetorical romanticism as to give the impression that he regarded them as standing on the same level with other Oriental traditions, besides altogether refusing to make the divine authority responsible for the savage deeds of ancient Israel. Religious opinion was not ripe for such treatment; the book raised a storm; and the series in which it was issued had to be discontinued.

During the period covered by this and the

preceding chapter English physical science has no great discoveries to show. The old stars continue to shine, but with a greatly diminished lustre ; the new stars are still far below their meridian splendour. This interval of obscurity may be accidental ; it may also be connected in some way, not yet understood, first with the unparalleled development of imaginative literature during the Regency, then with the wave of religious excitement marked by Edward Irving's preaching, or finally with the new devotion to political philosophy, critical or constructive, from which we started, and to which we must now return.

All the political thought of the time worth remembering is contained in the writings of three Benthamites—James Mill, Ricardo, and John Austin. For intellectual power and for inspiring genius the first place among these belongs to Mill ; but the greatest single contribution to positive knowledge, and that which was also of greatest practical importance, belongs to Ricardo. His position also clearly indicates the distinction between the philosophical and the popular Radicalism of the age.

Popular Radicalism found its ablest representative in Cobbett. This incomparable journalist has already been mentioned in connection with the revived interest in Paine's freethought writings. But his chief importance is, of course, purely political. Persistently devoted to the poor, and at the same time courting notoriety for himself, he carried on an implacable war against the Government during the Regency and after, not particularly affected, as would seem, by Canning's advent

to power. A steady advocate of Catholic Emancipation and of Free Trade in corn—less perhaps from any enthusiasm for those measures than because the high Tories hated them—he looked on the heavy load of taxation under which England reeled as the chief if not the sole cause of her woes. If bread was dear, the burdens under which the land groaned were responsible for its high price. The remedy was Parliamentary Reform. Let all taxpayers have a share in the representation proportionate to their numbers, and an end will be put to that iniquitous system by which the industrious classes are pillaged in order that fundholders, jobbers, and sinecurists may flourish in idleness.

Cobbett did not stand alone in believing that taxes, as distinct from corn-duties, raised the price of bread, or at least somehow obliged the landlords and farmers to raise it. What overthrew this view was the theory of Rent, first discovered in 1777 by Dr. Anderson, then forgotten, and simultaneously rediscovered by Malthus and West in 1815. At once adopted by Ricardo, it has since become exclusively associated with his name, for the excellent reason that he alone seized its full implications and made it the foundation of a complete theory of exchange. The theory says that rent means the surplus yielded by any land over the worst land in cultivation, and that it tends to increase with the increasing pressure of population on the means of subsistence, involving as this does the putting of ever poorer soils under the plough, or, what comes to the same thing, the application of more capital with diminishing returns to the same soil. Hence it follows that rent goes entirely

into the pocket of the landlord, and amounts to a tax levied by him on the rest of the community; while the unrestricted importation of foreign corn tends to lower his rents by throwing the worst soils out of cultivation, and its exclusion to raise them by allowing the process of extending cultivation to go on. Therefore the landowner is more interested in Protection than the manufacturers are, his advantage being perpetual, while theirs is soon reduced to zero by the pressure of capital into the protected industries.

Ricardo also showed that, *cæteris paribus*, profits rise as the cost of labour falls, and that this falls when the labourer's food costs less. Hence dearer bread means higher wages and less profits: the landlord's gain is the capitalist's loss. If the labourers multiply up to the limit of subsistence, as Ricardo thought they would, Free Trade in corn only adds to their numbers, not to their wealth; if in any way the demand for work can be restricted, they reap the whole benefit of cheaper food. Thus Protection for agriculture never favours their interest, and may be directly opposed to it. The landlord then must expect to see his privileges threatened by a combination of capitalists and working-men.

Ricardo's principles were pregnant with a future agitation, undreamed of by himself, for putting an end to that monopoly of the land which enables its owners to enrich themselves at the expense of the community by taking advantage of the pressure of population on the means of subsistence. Economists might still defend the private ownership of land on grounds of expediency. But he who takes

that ground must surrender the right to describe land-nationalisation as robbery. And an appeal to expediency does not act on public opinion with anything like the same force as an appeal to justice.

Another principle of Ricardo's is that manufactured articles of which the supply can be increased without limit exchange for one another in the ratio of their cost of production, which in the last analysis is determined by the amount of labour they embody. And as the theory of rent has been used to justify land-nationalisation, so also the Ricardian theory of value has been used by socialistic economists to justify their demand that the whole produce of labour should belong to the wage-earners, by whose labour it has been created.

Finally, Ricardo has shown that by a self-adjusting machinery the precious metals, considered as instruments of exchange, tend to diffuse themselves over the whole trading world in such a way that the imports of any particular country must ultimately balance its exports. For the excess of imports, if any, being paid for in bullion, prices at home are lowered by the scarcity of money, and prices abroad are raised by its abundance, until the importing country is obliged by the resulting dearness of commodities in the rest of the world to contract its purchases; while at the same time other countries are induced by the increasing cheapness of its commodities to buy more of them, paying in bullion until the normal balance is restored. Thus, for all who could master Ricardo's theory of foreign exchanges, was dispelled the

illusion, suggested by a temporary excess of imports over exports, that the country was living on its capital, and incurring the same liability to ruin as an individual who finds himself in a similar predicament.

Ricardo wrote his *Political Economy* at the suggestion of James Mill, the managing head of the Utilitarian school, by all of whom its principles were immediately adopted. Mill himself had made a great reputation by his *History of British India,* which also belongs to the early years of the Peace. It contains a rather contemptuous appreciation of ancient Hindoo mythology and literature, which is an implicit protest of Hellenism against Oriental unreason, then as now the object of much romanticist infatuation. The author's marked admiration for the French adventurers who at one time disputed with us the empire of the Mogul seems to show that leaning to France so characteristic of Scotch rationalism. But the most distinct moral of the whole work is conveyed in its exhibition of the wrongs that can be inflicted on a helpless people by a small group of irresponsible and ill-informed rulers. James Mill repudiated the idea of conferring representative institutions on India, looking rather, as we must suppose, to the growth of an enlightened public opinion in England for a redress of her grievances. With England herself, however, the case was very different. Here the people were fit for a widely extended suffrage, and ought to get it as their only safeguard against the spoliation and oppression which government by a small minority entails.

According to James Mill, the object of government is "to secure to every man the greatest possible quantity of the produce of his labour"; and its justification is the admitted fact that the strong possess themselves of what belongs to the weak whenever they can do so with impunity. Now, granting this to be true of men in general, it must be true in particular of the men to whom government is confided. They will use their delegated authority to satisfy their appetites; and, in order to do this with safety to themselves, they will not cease to extend it until they have reduced the people under their dominion to a state of abject slavery. For this difficulty there is only one solution — the establishment of a representative democracy, with short Parliaments elected by popular constituencies. The stringent responsibilities of the governing minority will prevent them from abusing their power; an almost complete identity of their interest with the interest of the whole community will prevent the controlling majority from abusing *theirs*.

Mill's reasoning is *a priori*, and, like all *a priori* reasoning, it is based on a limited experience—in this instance the experience of old Greek city life as interpreted by Plato and Aristotle, with which his classical studies had long familiarised him, supplemented at a later period by the history of India. His absolute monarch is a Greek tyrant or a Nawab; his aristocracy an oligarchic Athenian club. A very slight extension of the same reasoning, or of the same reading, would have furnished him with equally strong arguments to the effect that an uncontrolled majority of poor voters would

use their power to plunder the rich minority, thereby bringing about the economic ruin of the community.

Macaulay, who wrote a crushing refutation of Mill's *Essay on Government,* did not fail to press this last consideration. On that occasion he only used it as an *argumentum ad hominem.* But subsequently, in his private criticism on Jefferson's legislation, and in his public attack on the People's Charter, he denounced universal suffrage as something that would infallibly lead to confiscation. Yet for those gloomy vaticinations he had none but *a priori* reasons to offer; and it was precisely for applying the *a priori* method to politics that he so severely condemned James Mill. At bottom, logical preferences had very little to do with the controversy. Mill hated the Whigs as obstructive moderates; and Macaulay attacked him with bitterness, both as an enemy of Sir James Mackintosh and as a Radical fanatic who was endangering the prospects of Whig reform by advocating an extreme democratic solution of the electoral problem. Their views differed less in reality than in appearance. In politics Macaulay was half a Benthamite, and in morals all a hedonist; while Mill would have been satisfied with a Reform Bill giving the franchise to every man with £100 a year.[1]

In philosophy the elder Mill stood at the farthest remove from that mediæval scholasticism with which he was rather invidiously identified by his young reviewer. His work on Mind, the most important contribution to British metaphysics since Brown's

[1] Denis le Marchant, *Memoir of Earl Spencer,* p. 420.

treatise *On Cause and Effect,* developes and strengthens the traditional empiricism of Locke and Hume by definitely grafting it on the psychological theory of Association. He thus furnished the Benthamites with a system of thought to pit against the revived and Germanised Platonism which Coleridge had recently recommended to Lord Liverpool as the appropriate philosophy of Toryism.[1] And no doubt Mill's *Analysis* went far to undermine the Anglican dogmatism which Coleridge ostensibly supported in the *Friend.* Yet its interest is more didactic than speculative. Mill's object is to show how the very nature of mind, rightly understood, reveals an unlimited capacity for receiving new modifications and impulses from the teacher's art. Consciousness consists of trains of impressions and ideas whose course is determined by the relative frequency with which their external excitements are presented in contiguity with one another, and the ardour of emotion under which their union is sealed. Thus he who has unravelled and reconstructed the network of Contiguous Association holds in his hands all the threads of which true belief and right action consist. And at the same stroke the utilitarian critic of traditional dogmas claiming a natural or mystical self-evidence, is enabled to strip them of their glamour by an analysis of the casual experiences and passions under which they were formed.

A programme of reform stood ready, involving a considerable amount of new legislation; and it

[1] Yonge, *Life of Lord Liverpool,* vol. ii., pp. 300 *sqq.*

was agreed that, as a preliminary, a large popular element must be introduced into the government of England. But what exactly government and legislation meant had not yet been clearly explained. This office was performed by John Austin, next to Mill and Ricardo the most powerful Benthamite thinker of the period. In a course of lectures delivered at University College, London, in 1828 and the following years, he clearly distinguished positive law, as the command of a superior enforced by penalties, from the moral law, which is a matter of individual conscience or opinion, and from laws of nature, which are laws only in a metaphorical sense. In this way such notions as divine right and natural right were quietly and respectfully, but completely eliminated from the province of jurisprudence, while the undivided authority of the State found itself exalted to a position of autocratism before unknown. According to Austin, in every independent community positive law, which is the only real law, emanates from a power acknowledging no superior and subject to no external restraint. Governments fall into two fundamental classes according as this power is exercised by one or by more than one person. What we call a limited monarchy is really an aristocracy where one of the aristocrats holds a position of peculiar prominence and dignity. But all government, whether in the hands of one or of many, is essentially absolute, since there can be no legal restraint on that which is the sole source of law, and which cannot be resisted except at the cost of splitting the community into two by civil war. Nor is this fundamental absoluteness interfered with by the

current division into the legislative, the executive, and the judicial powers. All three are concerned in making and enforcing the laws, and all are but different organs and creatures of the same ubiquitous, omnipotent authority.

Austin gives the name of "Sovereignty" to this ultimate power of issuing unquestionable orders, enforced by penalties fixed and dealt out at the pleasure of its holders; and the persons holding it he calls "the Sovereign." Thus the emotions of awe and reverence traditionally associated with a personal ruler are transferred at a stroke to the impersonal body of which the titular king constituted at that time a part of continually diminishing importance.

The idea of Sovereignty was not new, being in fact revived from the political philosophy of Hobbes. But in practice it was associated, as Hobbes meant that it should be associated, with the institution of a hereditary despotism; and Locke, as the theorist of Constitutional Government, had set against it the idea of an indefeasible social contract, whereby each individual surrendered only so much of his natural rights as was needed to protect the much greater portion still reserved as his inviolable possession. The novelty was to convert that armed and irresistible champion whom Hobbes had imaged in the frontispiece of his *Leviathan* into an instrument of innovating and liberal legislation.

In defining the notion of Sovereignty, Austin professed to be merely analysing the fundamental conditions of all civilised government as experience exhibits them in actual operation, disencumbered of the fictions under which they are habitually

concealed; nor, indeed, with his discursive, dilatory, over-scrupulous intellectual habits, was he the man to set up irresponsible autocracy as an ideal where it did not already exist. But he had begun life as a soldier; and it may well be that familiarity with the rules of military discipline led him to reflect on their ultimate source and sanction. A commanding officer can have no other authority than what he receives from the civil government, which must therefore possess an even more peremptory claim on the obedience of its subjects than belongs to an agent clothed with merely delegated rights.

It has been said that the only ruler exactly answering to the description of Austin's Sovereign was the tyrant of a Greek city-state. He might have answered that before the powers of government could be seized and abused by a great criminal they must have already existed and been employed for more tolerable ends. To have a giant's strength is not necessarily to use it like a giant.

Definitions are often, if not always, postulates. A point of view is a practical direction, and the more so the more one-sided it is. Mackintosh had said that government was organised liberty. In practice this ideal worked out as organised license and impotence. The reformers could unpack their hearts with words and fall a-cursing like very drabs, but they could hardly put a single good measure on the Statute-book. What England wanted was not more liberty—except in religion—but better government; or, rather, the creation of a new machinery for bringing the inherent powers of government into play. Such a machinery was first supplied by Parliamentary Reform.

## CHAPTER VI.

## PROMETHEUS UNBOUND

"ENGLAND," said Disraeli, "does not love coalitions." If she does not love them, she had, under the unreformed Parliament, very frequently to put up with them. It was no easy matter to get and keep together a ministerial majority when there could be no appeal to a coherent body of opinion in the country; accordingly, the head of the Government often had, in the common phrase, to strengthen his position by giving his opponents a share of office. Such bargains involved a certain sacrifice of principle in one of the parties concerned, and most frequently in both; nor were the qualities most in demand a sure guarantee of administrative efficiency. Eloquence and readiness in debate secured more than their fair share in the distribution of prizes, on account of the weight carried by those gifts in a sovereign assembly whose members were free to indulge their personal predilections irrespective of any responsibility to their electors or to the country at large. It has been supposed that the decline in Parliamentary oratory after the Reform Act corresponded to a decline in the ability of the speakers, due to the fact that young men of genius had not the same facilities for entering on a political career when the number of pocket or purchasable boroughs at the disposal of the party chiefs was so reduced as to be no longer available for the purpose

of introducing every desirable candidate for office into public life. It is not clear, however, that Parliamentary ability, as measured by more permanent standards, has declined at all; and the decline in eloquence is amply accounted for by another cause. There has not been the same supply, for the good reason that there has not been the same demand. Eloquence has not the same value in a House where party-leaders, at the head of solid majorities, are engaged in pushing useful measures through as in a House where it matters less what Bills are carried than what applause is won.

Whatever its advantages as a means for introducing young men to public life, the system of Parliamentary patronage had the unquestionable drawback of exposing their political integrity to serious temptations—to the temptation, in the first instance, of enlisting under the banner of the magnate who offered them a seat, and to the temptation afterwards of deserting to the side of the Minister who could make them independent of his support. Even with an assured Parliamentary position, a statesman who stood outside the aristocratic ring was obliged, in default of popular support, to make his way by more or less discreditable intrigues, or by unworthy concessions to royal demands.

I have shown in the earlier chapters of this work[1] to what the power of the Crown amounted, and to what impotence it reduced the machinery of government, whether considered as an instrument of order or of progress.[1] The titular Sovereign, so far from

[1] *Supra*, pp. 4, 53, 74, 76, and 78.

giving concentrated energy to the will of the Sovereign in Austin's sense, acted as a drag on its movements in every direction. At last the evil corrected itself. As royalty sank into deeper and deeper contempt, Liberal opinion organised itself spontaneously under leaders drawn from the Tory ranks, and took in hand, to begin with, the destruction of the least defensible abuses. But even the mighty genius and dauntless will of Canning proved unequal to the task of safely steering a rotten bark down a torrent beset with such rocks and shoals. A few weeks after a Bill for relaxing the restrictions on the importation of foreign corn had been wrecked in the Lords, through the blundering of his own supporters, the great statesman perished by disease, as he might have perished by the headsman's stroke under a Tudor king. His Coalition Cabinet struggled on for five months, with the pitiful Goderich as its nominal head. Under it the guns went off of themselves at Navarino, putting an end at once to the tyranny of the Turks in Greece and to the tyranny of the Holy Alliance in Europe. Then came the still feebler Ministry of Wellington and Peel. Called to office as defenders of Church privileges, they signally betrayed their trust.

Up till then dissenters from the Established Church had been formally excluded from holding political offices in England, besides being subjected to sundry other disabilities by what were known as the Test and Corporation Acts. All who wished to evade the law could do so with impunity by receiving the Sacrament according to the Anglican ritual; and Protestant Nonconformists habitually had recourse to this subterfuge. But the obligation was

felt as a stigma; and the value of its repeal in 1828 on the motion of a young Whig, the celebrated Lord John Russell, with the consent of the Ministry, is evinced by Lord Eldon's passionate protest against such a dereliction of duty on the part of the Administration, the Lords, and the Bishops.

Next year Wellington and Peel not only conceded Catholic Emancipation, but themselves introduced and passed it as a Government measure. In the circumstances no other course was open to them; nevertheless, they and their party remained profoundly discredited by the surrender. What had so long been refused to reason was now avowedly granted to the threat of rebellion—an indication of the method on which future reformers might most safely rely for the satisfaction of their demands. Moreover, a most unfavourable contrast suggested itself between the political morality of the Whigs, who had submitted to so many years' exclusion from office rather than sacrifice their principles, and the political morality of the Tories, who sacrificed *their* principles to prolong their twenty years' tenure of office by some uncertain and inglorious months. Most degraded of all was the attitude of the faithless old voluptuary on the throne, who, false to his duty as a son and false to his pledges as a lover, now maundered feebly about the example of his revered father and the obligations of his Coronation oath.

If George IV. made the monarchy contemptible, his brother and successor made it ridiculous. William IV., a sailor prince, had the traditional manners of a boatswain on shore, still more accentuated by what seemed a touch of hereditary

insanity. A lover of popularity rather than of power, he had just character enough to bring a reforming Ministry into office, and not enough to defeat, although he disliked, the measure by which they revolutionised the Constitution and reduced the power of the Crown to a cipher.

With the new reign came a General Election. It was held under the shadow of that Revolution which overthrew the restored Bourbon monarchy and made the French once more a free people. Even with the very limited share of power given to the popular element by the Charter of 1814, Charles X.'s Ministers were defeated in the Chamber of Deputies by a majority of forty; and, on an appeal to the country, the victory of the Opposition received a decisive confirmation. The King replied by three Decrees, dissolving the new Chamber, altering the Constitution, and destroying the liberty of the Press. Then the people of Paris rose in arms, defeated the half-hearted troops sent to put them down, and in three days overthrew the government of priests and nobles imposed on them by the Allies in 1814. The Monarchy was provisionally maintained; but Charles X.'s place was taken by an ostentatiously *bourgeois* King, who, like William IV., walked about the streets alone with an umbrella under his arm, responding affably to the salutations of the passers-by.

The news of the glorious days of July excited the wildest enthusiasm in England and gave a decisive impulse to the cause of Parliamentary Reform at the elections then in progress.[1] It is worthy of remark

[1] Harriet Martineau, *Thirty Years' Peace*, vol. ii., p. 383.

that, although Canning hated reform, the forces he had set in motion were entirely favourable to its advance. His pro-nationalist policy broke up the Tory party and created a group of statesmen who were prepared to carry that coalition with the Whigs which he had begun to the length of absolute coalescence. By winning over France to the Greek cause he had separated her government from the German despotisms, and so left it a helpless prey to the Revolution. Even his South American policy, apart from the countenance it gave to republicanism, told accidentally in the same direction. For the new openings it afforded to our trade, by stimulating the wildest speculation, caused a vast loss of capital and brought about that terrible commercial crisis in which, among other catastrophes, Scott's whole fortune was engulfed. This, again, led to a long-continued period of distress, extended over the whole country, and still further aggravated by the bad harvest of 1829. As usual, the Government was made responsible, the more so as its policy of Free Trade, inherited from Canning, had to bear the blame of the prevalent industrial stagnation. Even Catholic Emancipation told in favour of the Reformers. For the settlement of the question gave them back the alienated affections of the English middle class, whose bigotry made them unwilling to put in power a party pledged to carry that detested measure. As Macaulay observes, with its passage "the solitary link of sympathy which attached the people to the Tories was broken; the cry of 'No Popery' could no longer be opposed to the cry of 'Reform.'"[1]

[1] *Miscellaneous Writings, Speeches, and Poems,* vol. ii., p. 430.

Liberalism had not a majority in the new Parliament, but the Ministerialists lost so many seats, and so many of the Tories returned were bitterly hostile to Wellington and Peel as apostates from Protestantism, that their position proved untenable, especially after the Duke had alienated the most moderate Reformers by a declaration of his belief in the unsurpassable perfection of the English Constitution, made without consulting his colleagues, of whom some would have gladly coalesced with the Canningites on the basis of a compromise with the popular demands. Thus disunited and unsupported, his Ministry fell before an adverse vote within a fortnight after Parliament met.

These details are important because they show that the constitution Wellington pronounced ideally perfect had ended by simply making it impossible for the King's Government to be carried on. Not merely a certain number of boroughs, but the whole system was rotten. A really strong aristocratic system might have resisted popular clamour with success; but such a system was incompatible with the power of the Crown on the one hand, and of the popular element in the House of Commons on the other—forces by which the nobles were permanently split into two factions, appealing to one or other of them for support. The sole remedy was to transfer sovereignty from this shifting chaos to some one part of the community sufficiently powerful and homogeneous to outweigh all the other parts put together, or at least any combination of parts ever likely to be formed in opposition to its will.

Such a body lay ready to hand in the middle classes of England, understanding by that name the whole mass of citizens who were neither obliged to maintain themselves by manual labour nor enabled to live in idleness on inherited property. In numbers a small minority of the whole people, they possessed by far the largest share of its accumulated wealth and educated intelligence, with probably on an average more than their proportionate share of its morality—advantages still further enhanced by the continual accession to their ranks of the best and ablest men from the working classes, and of those who were compelled by narrow means to descend from the aristocracy and to seek for a living in the professions. With very few exceptions, all that makes England great owed its origin to members of this class; and she would have been far richer in the elements of national well-being had not its development been repressed by the superincumbent weight of a territorial oligarchy whose acres were broader than their minds.

The leading Reformers agreed in thinking that the object of a great readjustment of the representation should be to place supreme power in the hands of the middle class. In advocating a wide popular suffrage with or without a small property qualification, James Mill, an advanced Radical, argued that the working-men electors would be guided by "the intelligence of that virtuous rank who come the most immediately in contact with them.....to whom they fly for advice and assistance in all their numerous difficulties.....to whom their children look up as models for imitation, whose

opinions they hear daily repeated and account it their honour to adopt."[1] And he had no doubt that the middle class was "that portion of the community of which, if the basis of Representation were ever so far extended, the opinion would ultimately decide." Brougham also—no Radical, but a conservative Whig—identifies the people of England with the middle classes, "the genuine depositaries of sober, rational, intelligent, and honest English feeling, looked up to by the populace as their kind and natural protectors."[2]

Now it was just because the middle classes were so representative of the people, so wealthy and so intelligent, that some thoughtful and far-sighted English statesmen dreaded their advent to power. They saw that the House of Commons had become, in Canning's words, "the preponderant element of the Constitution." But "if it were to add to its real active governing influence such an exclusively popular character.....as would arise from the consciousness that it was the immediately deputed agent for the whole people and the exclusive organ of their will, the House of Commons, instead of enjoying one-third part of the power of the State, would in a little while absorb the whole." Neither the House of Lords nor the Crown could "presume to counteract the supreme authority of the nation assembled" in Parliament, with the result that we should risk losing "that equality and co-ordination of powers among the three branches of our present Constitution in which its beauty, its strength, its

stability, and the happiness of those who live under it consist."[1]

So, with the prescience of genius, spoke Canning in 1822; and such doubtless was the view taken by many brought up, like young Gladstone, "under the shadow of his great name."

There was this much truth in the argument for the supreme excellence of our balanced Constitution, that a weak and even rotten Government had favoured the growth of individual enterprise and genius in England for the last two generations. But then that very development had itself created a demand for reforms which only a strong Government could carry through. The most brilliant of the newly-elected Whig members, a thoroughly middle-class man, who had won his seat—a pocket borough of Lord Lansdowne's—by attacking Bentham while himself a Benthamite as regards legal reform, the Edinburgh reviewer Macaulay, argued very truly that the value of a Legislature ought not to be estimated by the general prosperity of the country, but by the way in which its own proper work of legislation was done; and that, judged by that standard, the unreformed Parliament deserved the severest condemnation, the civil and criminal laws of England being as much a disgrace to her rulers as her material prosperity was a glory to the people.[2] And Brougham, also in law a pupil of Bentham, speaking for the Whig Ministry, declares that they "seek the support" of the middle classes, "by salutary reforms not merely in the representation, but in all the branches of our

financial, our commercial, and our legal polity."[1]

The real chief of the fallen Ministry, now Sir Robert Peel, had indeed signalised his tenure of office by some modification of the sanguinary penal statutes denounced by Macaulay, and had greatly added to public security by the creation of an efficient police. But a truly representative Parliament would have dealt with the penal laws much sooner and much more thoroughly; and the new constabulary would have been more popular had they not been identified with the machinery of aristocratic oppression. There are not many sadder things in English history than that Peel, himself sprung from the middle class, and, like Pitt and Canning, born to guide it on the path of progress, should have been separated by fate from his natural supporters, and made illustrious by deserting the positions he had been retained to defend.

The place left vacant by the collapse of Wellington's forlorn Administration was filled, in fact if not in name, by a Coalition Cabinet, a combination of Whigs and Canningites under the lead of Fox's most dignified follower, Earl Grey. Although chosen to carry out the will of the middle class, it was exceptionally aristocratic in constitution. Its only middle-class member, and also by far the ablest, Brougham, sat in the House of Lords as Chancellor. The majority of his colleagues were hereditary peers, and the Ministers who sat in the Commons were mostly lords or the sons of lords.

[1] *Speeches*, ii. 601.

Their views on Reform differed widely, but the most aristocratic were not the least advanced. The scheme ultimately agreed on was a compromise based on the principle of making the smallest change in existing institutions consistent with the nearly complete admission of the middle class to political power. For innovating purposes a more sweeping measure might have proved less effectual. It seems unlikely that Household Suffrage, vote by ballot, shorter Parliaments, or even a closer adjustment of representation to population, would have made the transfer of sovereignty more absolute; a considerable enfranchisement of working men might even have weakened the people by dividing them against themselves and limiting their choice to candidates rich enough to contest very large constituencies. Lord Grey assured the King that his Bill was really aristocratic; and it was so in the sense of leaving the highest class a practical monopoly of administrative power; but in all probability any manipulation of the electorate would have had the same effect. What it did do was to institute popular sovereignty (in Austin's sense), and to destroy the power of the Crown; but the Prime Minister, as a theoretical Republican, would view this revolution without alarm.

The first Reform Bill passed the second reading by a majority of only one, and was wrecked by an amendment in Committee. An immediate dissolution gave the country, imperfectly represented as it was, the opportunity for an unequivocal expression of its opinion. Of eighty-two English county members seventy-six were returned pledged to support the Bill, as were also all the representatives

of the cities and the great towns. In the new House the second reading of the second Reform Bill passed by a majority of 136. The Lords threw it out by a majority composed of Bishops and of peers created since the French Revolution. Riots occurred in various parts of the country, and there was some talk of refusing to pay taxes. Wellington and Peel had yielded Catholic Emancipation to avoid civil war in Ireland; yet they countenanced a policy of resistance to the will of the people in England at the risk of the same calamity, and with the certainty of ultimate failure. When the Bill passed the Commons a second time—on this occasion by a majority of two to one—Peel still advised the Lords to throw it out, his avowed object being to discourage future attempts in the same direction, by making the innovator's task as difficult and repulsive as possible.[1] This time, however, they agreed to the second reading, but soon afterwards passed a wrecking amendment in Committee. On the King's refusal to overcome their resistance by a sweeping creation of peers, the Whig Ministers resigned, and Wellington accepted office on the understanding that he was to introduce a new measure of Reform on rather more moderate lines; but Peel, whose co-operation he invited, would not be a party to any such disreputable scheme for saving the dignity of the King and the Upper House. The two chiefs had different and conflicting standards of honour. The Duke, after declaring against any sort of constitutional change as bad in itself, was ready to pocket

his principles for the convenience of his royal master; Sir Robert, as a party leader, objected to making himself and his followers responsible for a disturbance in existing arrangements which they had publicly denounced as inexpedient and unjust.

The advanced Liberal leaders were confident that, if it came to a trial of strength, the people would win, as they had won in Paris and Brussels. But they dreaded the consequences of victory. It would mean the establishment of pure democracy, for which, in their opinion, the country was not ripe. At this juncture Francis Place, a Radical tailor of high organising ability, and, for practical purposes, the wire-puller of the Benthamite party, hit on an effective scheme for baffling the Court intrigues by which William IV., under the influence, as was believed, of his German consort, had been won away from the popular cause. On Sunday, May 13th, 1832, he placarded the walls of London with bills containing merely the words: "To stop the Duke, go for gold." The result was a run on the Bank which lasted a week. But long before the week was over the placards had done their work; for on Tuesday the King had sent for Earl Grey, and on Friday permission had been obtained to create as many peers as were necessary to pass the Bill. The threat sufficed to bring the Lords to their senses, and on June 4th the third reading was carried by 106 to 22.[1]

In one important respect the measure that became law differed from the original plan. The county

franchise, which in the first Bill had been restricted to forty-shilling freeholders, was extended, against the will of the Government, to copyholders, leaseholders, and tenants-at-will paying £50 a year. This change introduced a class of voters very much under the influence of the landowners; and, as the number of county members was simultaneously increased from 94 to 159, the landed interest obtained a great accession of strength, just at a time when the total abolition of the Corn Laws had become a leading item in the Radical programme.

Events soon showed that the Reform Bill had done precisely what was expected from it by friends and foes alike. A legislative machine had been created capable of carrying the will of the middle classes into effect. Twenty years of Parliamentary agitation had been needed to destroy such an indefensible iniquity as the slave trade. In the very first session of the Reformed Parliament West Indian slavery, a less unquestionable evil, was abolished without resistance. The work of law reform was greatly accelerated. Those sanguinary penal statutes mentioned by Macaulay as an accompaniment of the rotten-borough system were rapidly repealed; and "since 1838 no person has been hanged in England for any offence other than murder."[1] After clearing off all the arrears of Chancery business in his first year of office, Brougham proceeded to the work of reforming the civil law on Benthamite principles. He created the Judicial Committee of the Privy Council; he

[1] Walpole, *History of England,* vol. iv., p. 405.

created the Central Criminal Court; he took the first step towards the creation of County Courts; by abolishing fines and recoveries he greatly simplified conveyances; his Bankruptcy Bill became the germ of future legislation on the subject. Codification, on which Bentham and Austin laid so much stress, has unfortunately not yet been applied to English law.

India, as a despotically governed dependency, presented a freer field than England for the introduction of modern ideas. One of the demands of the new democracy had been that the trade monopoly of the East India Company should be put an end to. The privilege was taken from them in framing the new Charter of 1833. That instrument completed what the philosophic statesmen of the eighteenth century had begun—the transformation of the Company into a delegated agency for advancing the greatest happiness of the greatest number in a region where the co-efficient of possible felicity rose to hundreds of millions. The era of beneficent activity had, indeed, already begun. In 1827 Canning sent out as Governor-General of Bengal Lord William Bentinck, the son of a great Whig noble, and himself half a Radical. This illustrious humanitarian abolished flogging in the native Indian army, and put down Suttee, or the religious custom of burning widows alive, with as little scruple as he put down Thuggee, or the religious custom of strangling people in general. What was more, he instituted the system of admitting educated Hindoos to posts in the judicature—a most important step, not only as opening to them an honourable career, but also as making a

provision for public order without a ruinous addition to the financial burdens of India. During Wellington's Ministry it was more than once proposed to recall the reforming Governor, but Earl Grey's advent to power finally secured his position. Two years afterwards the Act that converted the Company into a purely political body made him the first Governor-General of all India; and for several months before resigning he enjoyed the assistance of an enthusiastic admirer in the person of Macaulay, who, after eloquently defending the new system of government as Secretary of the Board of Control, had been sent out to India as a member of the Supreme Council.

Macaulay himself thoroughly reformed the higher Hindoo education by substituting the study of English for the study of Oriental literature; and he gave India a Penal Code constructed on Benthamite principles, which a high authority, Fitzjames Stephen, prefers to the codes of France and Germany, and even regards as his most lasting monument. It did not, however, come into force until some years after the Mutiny—that is to say, after the clumsy system of a dual government had been abolished.

In order that utilitarian principles might be applied to the benefit of India, it was necessary that European methods of order and progress should be put into action through the whole peninsula, with no more regard for Asiatic prejudices than prudent policy required. A different rule was required for the good government of Colonies peopled by settlers of English or European race.

Experience has shown that these had better be left to manage their own affairs, without interference from the mother country, though not without such a measure of protection as their exposed position may necessitate, and such a community of citizenship as interest and affection may demand. A crisis in Canada, brought on by a long and complicated series of events not necessary to relate here, gave the English reformers an opportunity to declare that our relations with the Colonies should henceforth be conducted on rational principles. In Upper Canada a struggle between a jobbing oligarchy and the bulk of the Colonists, in Lower Canada a struggle between the old French and the new English settlers—aggravated, both of them, by the mismanagement of the Home Government—had led to insurrection and civil war. At length, in 1838, Lord Durham was sent out to compose the strife. He was Earl Grey's son-in-law, and the most advanced member of the Reform Cabinet. Many looked on him as the future leader of the progressive party in England. But his hasty and imperious temper made him an unsafe friend and a safe mark for foes. As Canadian Governor-General his policy was so fiercely assailed and so feebly supported at home that in a few months Durham felt compelled to resign. But the work for which he went out was already in principle accomplished. The celebrated Report issued under his name, which has guided the policy of all his successors, owes its origin to Benthamite inspiration. "I," says John Stuart Mill, the intellectual head of the school, "had been the prompter of his prompters. Lord Durham's report, written by Charles Buller,

partly under the inspiration of Wakefield, began a new era; its recommendations, extending to complete internal self-government, were in full operation in Canada within two or three years, and have since extended to nearly all the other Colonies of European race which have any claim to the character of important communities. And I may say that, in upholding the reputation of Lord Durham at the most important moment, I contributed materially to this result."[1]

It is to be noticed that the personality of William IV. placed a serious obstacle in the way of Canadian reconstitution, and that the acceptance of Durham's report was probably not unconnected with the advent to the throne of his successor, a young Queen whose indifference to politics facilitated the assumption of undivided sovereignty by middle-class opinion.

Thus, alike at the centre and at the extremities of the Empire, the tendency of the English Revolution was to substitute order for chaos, progress for corruption, and, to some extent, government by consent for government by constraint. Less brilliant and impressive than the changes so far passed in review, but perhaps even more intimately related to the future reorganisation of social life, was the municipal reform effected in 1835. Till then the borough corporations had been squalid little close oligarchies, worked in the interest of their patrons, Whig or Tory, and rewarded by the conversion of the public property under their control

into sources of private emolument. A Bill, transferring the management of the boroughs from these privileged individuals to the bulk of the ratepayers, was denounced by the extreme Conservatives as an invasion of the rights of property—the favourite metaphysical figment on that side, as the rights of man had been on the opposite side forty years before, and with less reason at the bottom of it. But Peel, who was assuming more and more the part of a middle-class leader, supported the Bill in the Commons; and, when the Lords returned it amended out of recognition, he stood by the Government in restoring the original outlines of their scheme.

So far we have been concerned almost solely with the reorganisation of government. We have now to consider how the new powers thus acquired were used for the common good.

First in importance comes the new Poor Law of 1834. It has been related in a former chapter how, under Pitt's rule, an unlimited extension was given to outdoor relief, and how this measure had contributed, with other causes, to stimulate the economical speculations of Malthus. His ideas were accepted by the Benthamites, whose opposition to indiscriminate alms-giving placed them on this point in sharp antagonism to the more impulsive Radicalism represented by Cobbett, as well as to those Tories who, partly from genuine philanthropy, partly from dislike of the manufacturers, wished to protect labour against the tyranny of capital. On the other hand, they had the full support of the leading Whigs, among whom, indeed, Malthus

himself may be reckoned. But the facts of the case spoke louder than any political partisan. A Commission, appointed to investigate the working of the Poor Law in 1832, reported in 1834. It showed —to borrow Brougham's energetic language—that those laws "had succeeded in wholly disconnecting the ideas of labour and its reward in the minds of the people; they had encouraged the idle and the profligate, at the expense of the honest and industrious; they had destroyed the independence of the peasant, and given him the degradation of a beggar"—with the assurance, which a beggar had not, of receiving alms whenever he chose to demand them.[1]

In one place a young man, the type of many more, was found saying: "I do not want work; I would rather have my 3s. 6d. from the parish without working than toil to get 10s. or 12s. a week." And, as the orator added, such young men in all probability supplemented the parish allowance with the profits of crime. Nor was the demoralisation limited "to inland places and to lazy rustics." The Kentish sailors, once renowned for their adventurousness and daring, would no longer put out to sea in winter, provided as they then were by the parish with 12s. a week.[2] The evil tended to perpetuate and aggravate itself by the contagion of example and by stimulating the growth of population. For every additional child the parish gave an additional allowance of 2s. a week; and as illegitimate children came in for the same privilege, a direct premium was put on

unchastity, the mother of a large family of bastards being eagerly sought after in marriage. Thus the burden increased more rapidly than the backs on which it was borne. The weight of pauper expenditure, in proportion to the population, at the two periods, was as seven in 1831 to four in 1801.[1]

To complete the stringent logic of the verification given to economic principle by this vast economic experiment, a negative instance was forthcoming. Over the whole of Scotland, where a different system of administering relief prevailed, no such evils existed; and in some favoured English districts, where a more rational administration had been adopted, industry flourished, and the poor-rate came down, first to one-half, and afterwards to one-third.[2]

A system securing a pension to every man at any age on demand might have been expected to raise the rate of wages by making the labourer independent of his employer. It had the contrary effect. As doles in aid of wages were allowed, the labourers accepted less than the cost of living would otherwise have compelled them to demand, with the result of shifting the burden of their maintenance on the ratepayers who did not profit by their work.

An end was put to these ruinous abuses by the Poor Law of 1834. It provided that henceforth outdoor relief should only be given to the sick and aged. Able-bodied paupers were only supported at the public expense in buildings where they were

[1] Porter, *Progress of the Nation*, vol. i., p. 84.
[2] Brougham, *op. cit.*, p. 502.

set to do unpleasant work on food sufficient to support life, but studiously kept under the mark of what a labourer in receipt of moderate wages could command. Existence in these workhouses was not agreeable, nor was it intended to be so; but their popular nickname of New Bastilles (pronounced Bastyles) was singularly ill-chosen. The old Bastille was a place where persons of the higher classes were detained, against their will, in idleness and relative luxury during the King's pleasure, with permission for married couples to live together; whereas nobody need enter a workhouse or remain there for any time against his will; and one of the rules most objected to was that a strict separation of the sexes prevented the breeding of hereditary paupers.

Another merit of the new law was that it created an administrative machinery, placing the raising and distribution of parish relief under the control of Boards elected by the ratepayers, supervised themselves by a central office in London.

The new Poor Law was angrily denounced by Cobbett, and by John Walter, a moderate Liberal, in the *Times;* but it passed both Houses by large majorities, Wellington, who loved superlatives, declaring it to be "the best Bill ever devised." Its real author was one of the Commissioners, Edwin Chadwick, an intimate friend and disciple of Bentham. Chadwick also took a leading though unseen part in another work of constructive legislation, the whole credit of which has fallen to others. This was the Factory Act of 1833.

It has been shown in a former chapter how the

old English Constitution, with its fortuitous system of checks and balances, by preventing the formation of a strong government, left powerful individuals and interests free to exercise grinding oppression on the most helpless members of the community, and how the most pitiful and unpitied among these unfortunates were the little children worked to death by factory labour. The reforming movement, genuine though feeble, of the early nineteenth century did something to ameliorate their lot. A pestilence caused by the insanitary condition of the Manchester factories, where child-apprentices were employed, led to an Act reducing their hours of work to twelve a day (1802). As an unintended result the atrocious apprenticeship system was discontinued, but only to be succeeded by the direct purchase of children from their own parents for the same exhausting toil. The Act of 1802 did not apply to this new category of infant slaves, who were treated almost as brutally as their orphan predecessors.[1] Sir Robert Peel, the great statesman's father, introduced another Bill in 1816, limiting all child-labour in factories to ten hours a day, and in this form it passed the Commons; but the Lords raised the time to twelve hours, and restricted the measure to cotton mills. After all, the number of hours and the description of labour mattered little if, as we are told, the law remained a dead letter.

So matters stood until the reforming era of 1830, when a great agitation on the subject of child-labour and overwork in general sprang up, headed by representatives of all parties in the country. It was

[1] H. de B. Gibbins, *Industrial History*, p. 391.

not originally excited by any feeling of jealousy on the side of the landed interest against the manufacturers. On the contrary, the first public protest was raised in the manufacturing districts themselves. It came from the pen of Richard Oastler, who, though steward of a landed estate, had lived for many years in the heart of the factory districts, and was supplied with his facts by J. Wood, a Bradford manufacturer. Michael Sadler, an eloquent advocate of the poor, was induced by his representations to bring the subject before Parliament. Sadler was in the linen trade, and, like Oastler, a high Tory; but the first Bill for putting an end to child-labour and restricting the labour of boys and girls under eighteen to ten hours a day, was introduced by Hobhouse, a Radical, and Lord Morpeth, a Ministerial Whig. Neither is it true that political economists, as such, were opposed to legislative interference with the employment of children in factories. Malthus refers to it with approval,[2] and it subsequently received the support of McCulloch.

Sadler had no seat in the reformed Parliament, and the initiative passed from his hands to the abler guidance of Lord Ashley, so famous in the annals of philanthropy under his later title of Lord Shaftesbury. He was inspired by a deep religious feeling of the Evangelical cast, as also were Oastler and Sadler. But among those who deprecated hasty legislation were some whose love of humanity did not yield to theirs. Lord Althorp, the Whig leader of the House of Commons, rightly insisted

on a Parliamentary inquiry into the facts of the case, and a Commission was appointed for the purpose. One of the Commissioners was Edwin Chadwick, the Benthamite. He, we are told, "was the chief author of the Report which recommended the appointment of Government inspectors under a central authority, and the limitation of children's work to six hours daily.[1].....Among other proposals in the Report was one that employers should be held responsible for accidents to their work-people—a suggestion that has only been carried into effect by the Employers' Liability Act (1898)." It may be said that this proposal, as being no more than a new provision for the redressal of injuries, still remains within the limits of that individualism with which Benthamism is commonly identified. But no interpretation of individualism will cover Chadwick's recommendation, made before a Committee of the House of Commons in 1837, that the traffic in spirituous liquors should be restricted, and that healthy recreation for the people should be provided.[2]

Bentham's school was, in truth, pledged to nothing but the reorganisation of individual and social life on a basis of pure reason, with the greatest possible increase of happiness for its end. As the proximate means to that end the identification of private with public interest was prescribed; and again, as a means to that secondary end, the transfer of political power from the aristocracy to

[1] By the Bill actually passed in 1833 children under nine were forbidden to work at all, the labour of children under thirteen was limited to eight hours a day, and the labour of young persons under eighteen to sixty-nine hours a week.

the people. To what extent the compulsion implied in every exercise of power should be carried remained a question not of principle but of detail. A good deal of reforming activity was directed towards the removal of restrictions on the open expression of opinion, on locomotion, on trade, on colonial autonomy, on the independence of foreign nations, on the personal liberty of negroes, or, again, towards the removal of disabilities connected with religious belief; and the association of Liberalism with the systematic struggle for universal emancipation led to its occasional identification, in the minds both of Liberals and Conservatives, with a rooted hostility to all restrictions on liberty as such. The nature-worship of the eighteenth century, continued far into the nineteenth, gave a sort of religious sanction to this feeling. But the Benthamites, at any rate, were inaccessible to such illusions. They no more believed in nature as a lawgiver than they believed in the Pentateuch; and, however much they may have regarded individual interest as a safe guide for the economic man, they held that man, as a lawyer and legislator, was in most instances set against the general interest by exclusive attention to his own advantage, and that this divergence would continue until the two were brought into coincidence by a new system of government and education—a theory borrowed, consciously or not, from the idealistic philosophy of Plato. And even their political economy embodied one very important exception to the general principle of letting things alone. For they fully accepted Malthus's theory of population, according to which the mass

of mankind could only be rescued from abject poverty by habitual disobedience to the most imperious of natural instincts.

The new Poor Law was in the first instance a triumph for the principle of *laissez-faire* by withdrawing the artificial encouragement previously given to the idle and improvident as well as to the multiplication of their numbers. But it also brought up the question whether, besides withdrawing bounties, artificial checks should not be imposed on the growth of population; and still wider issues were opened by the Report of the Commission on factory labour. It was no derogation from the principle of free contract that children should not be sold into slavery and worked to death; but to interfere with the contracts between their parents and the manufacturers involved the assumption of new responsibilities on the part of the State, going far beyond the mere duty of maintaining order.

Nor could the question be long argued on grounds of mere abstract metaphysical right. As a result of child-labour the population of the manufacturing districts was found to be fast degenerating; and this alone seemed to justify restrictive legislation, for any theory that forbids the State to protect the health of its citizens stands self-condemned. But if so, then the insanitary employment of women, the future mothers of the race, likewise called for State intervention, as well as their employment in trades of a demoralising character. And this, again, suggested serious doubts whether they, any more than children, were capable of contracting freely for themselves. Finally, the labour of the various

classes of operatives employed in factories was so interdependent that the hours of one set could not be abridged without bringing the others to a standstill—a circumstance which would suggest the desirability of fixing a shorter legal day for men also, thus entailing a fresh inroad on the theory of *laissez-faire*. In social as well as in physical science the applicability of metaphysical conceptions broke down under the stress of fact.

Not that the rigid economists would allow the existence of any such discrepancy between fact and theory. They claimed that the violated law of *laissez-faire* would soon avenge itself in famine. Shorter hours meant diminished production—that is, a less amount of capital available for the payment of wages. The answer was that the produce of labour would increase with its efficiency, and that this depended on the health and strength of the operatives, which would gain by their working for shorter hours. As for the children, new machines were invented to do the work from which they had been debarred. And, apart from this expedient, recourse was had to the simple device of employing them in successive shifts, so that a child, though not the same child, was always available for the office required.

Edwin Chadwick, the real author of the Factory Commission Report, had no scruples about the State regulation of labour; and his recommendation that the children should be sent to school during the time saved off their work proves that he had none as regards compulsory education either. Compulsory or not, State education signally violates

the principle of *laissez-faire*. It is therefore noteworthy that the first proposal to establish a system of national State education was made in 1837 by Roebuck, at that time a Benthamite, and seconded by Grote, who remained a Benthamite through life. Roebuck advocated a purely secular system of teaching, and wished that the cost should be defrayed out of Church property. Government took the question out of his hands, and provisionally settled it by granting £30,000 in aid of the National Society and the British and Foreign School Society. It will be remembered that these societies grew out of the systems of Bell and Lancaster respectively, one being supported by Church people and the other by Nonconformists. As the amount allotted to each body was proportioned to the local contributions it received from private sources, and as the National Society was much the richer of the two, the Ministerial plan amounted to a fresh endowment of the Church of England at the expense of the people.

Lord Brougham, as a Scotchman, was an enthusiast for education, and had more definite ideas about it than any of his party. He observed that under the voluntary system school attendance in England had more than doubled in fifteen years; and he feared that the State might do more harm than good by taking the movement out of the hands of private enterprise. But he could not conceal from himself the fact that the supply of education given fell far short of the demand, and was even more deficient in quality than in quantity. As a Scotchman, again, he was more open to French influence than his English contemporaries.

Deeply impressed by the success of the Normal schools in France, he proposed that similar institutions for the training of teachers should be established among ourselves. The cost would be trifling and the benefit immense. He also proposed to organise a system for the administration of the funds, whether charitable or public, available for educational purposes, consisting of elected committees all over the country under the direction of a Central Board in London.

When Brougham made these proposals he had ceased to be a member of the Government; but his scheme was adopted by Lord John Russell in 1839, with the omission, however, of the elected committees. Even so, the clergy were infuriated at the prospect of losing their ascendancy, and in the face of their opposition the proposal for a Normal school had to be withdrawn; while the proposal to place all the assisted schools under the inspection of emissaries from a Committee of the Privy Council could only be saved by subjecting them and their reports to the approval of the Bishops.

The failure of the middle-class Parliament and its elected agents to cope adequately with the educational question shows out more conspicuously by contrast with their energy and courage elsewhere. At this very time they were reforming the postal system by introducing a low uniform charge for the delivery of stamped letters all over the kingdom on a uniformly graduated scale of weights, at the same time abolishing the privilege, enjoyed by some among the rich, of sending their letters free. The

difference was that this and the other great reforms effected in previous years, or to be effected not long afterwards, were either accepted without distinction of party or were carried against party opposition by the overwhelming pressure of public opinion which the new representative system brought to bear directly on the rulers of the people, while giving them power to execute its will. Popular education, on the other hand, though usually demanded by democracies, was not pressed on the governing classes with any such unanimity, because it had become so associated with religion as to be fatally hampered by the religious anarchy of England. Nonconformity had contributed to the growth of English individualism, and so far must be credited with its share of whatever benefits we owe to that tendency; but it is also responsible to the same extent for that paralysis of the Government which made it nearly useless as an instrument either of order or of progress. Moreover, by the stimulus of opposition it had made the Church more sectarian; while by breeding religious rivalry it had stimulated those particular religious beliefs which are most unfavourable to the growth of science and reason.

Nonconformity has always found its strongest political basis in the middle class, and therefore its importance was greatly enhanced by the revolution which made that class supreme in the State. Advantage was taken of the change to procure the removal of some grievances under which Dissenters still suffered. They received permission to marry in their own chapels, or without any religious ceremony whatever at the registrar's office. In 1836, against the protests of Oxford and Cambridge, a Royal

Charter incorporated the University of London, enabling it to give degrees without the acceptance of any religious test or the passing of any religious examination. A Bill to abolish religious tests in the two ancient universities had passed the Commons by a large majority two years before, but had been rejected by the Lords.

Another grievance of the Nonconformists, payment of Church rates (that is, being taxed to support places of worship which they did not use, and often did not approve of), was left without a remedy by the reformed Parliament. The Whig Ministers proposed to throw the expense of keeping up Church buildings on Church property, but could not overcome the resistance excited by this most equitable arrangement.

In proportion to their grievances Irish Roman Catholics were much worse treated than English Protestant Dissenters by the English middle-class Sovereign. An alien Church, numbering but a small fraction of the Irish people among its members, was established in their midst, and supported by the labour of a peasantry who for the most part detested it, spent on lands originally devoted to the maintenance of their own clergy. Its revenues were levied under the form of tithes; and payment of them under that form, the most noxious conceivable, was resisted with every circumstance of outrage on the collectors by the aggrieved cultivators of the soil. These poor people were told with stupid pedantry that if tithes were abolished their rent would be raised to an equivalent amount, and that the money would go

into the pockets of Protestant landlords. Nothing could be truer; but it remained equally true that if this revenue, either under the name of tithes or of rent-charge, were handed back to its original owners, the Catholic parishioners who now had to support them would henceforth be relieved from that heavy expense. If, on the other hand, it were considered inexpedient to re-endow the Roman priesthood, there was the alternative, since adopted, of secularising Church property, and devoting it in other ways to the relief or improvement of the poorer classes. Finally, there was the plan of commuting tithes into a rent-charge to be used for the payment of the clergy of the Established Church.

The last-named course was ultimately adopted by agreement between the two great political parties in 1838. The reason why it was delayed till then is so characteristic of English public opinion at the time that a reference to it will be instructive.

One of the earliest measures proposed by Lord Grey's Ministry in the Reformed Parliament dealt with the temporalities of the Irish Church. It proposed, very reasonably, that two of the four Archbishoprics and ten of the twenty-two Bishoprics then existing should be suppressed; that the Bishops' lands should be vested in ecclesiastical commissioners, who were expected to make more out of them than their existing holders; that the stipends assigned to future Bishops should be considerably less than the incomes received by the present Bishops; and that the surplus revenues, if any, thus obtained should be devoted to secular uses.

This last provision, known as the Appropriation

Clause, encountered such violent opposition, even among the Whigs, that it was provisionally withdrawn, and the Bill passed both Houses without any other material alteration. Next year Lord John Russell revived the Appropriation Clause. Subsequently accepted more than once as part of an Irish Tithes Bill by the Commons, it was rejected on each occasion by the Lords, and finally abandoned by its authors. The leading Whigs were in advance of their age, but their liberality only served to drive some of their ablest men into the Tory ranks, and to prolong Irish discord by postponing the commutation of tithes.

"All the wise men were for Catholic Emancipation," said Lord Melbourne, "and all the fools against it—and the fools were right." If the fools were right, it was not for the right reason. What they anticipated did not come to pass. The Roman Catholic members have not used their Parliamentary position as an instrument for the destruction of Protestantism and religious liberty in England. But the wise were mistaken in thinking that Irish discontent would be appeased by a single instalment of justice. While grievances remained agitation was bound to continue, especially as, thanks to the fools, the long delay of emancipation had taught the Irish people and their great leader, O'Connell, how much could be effected by its systematic employment against rulers who yielded to violence what they would not yield to reason. Resistance to the exaction of tithes was met by a Coercion Bill substituting martial law for the ordinary processes of justice in the disturbed districts, and placing the right of meeting every-

where at the mercy of the Lord Lieutenant. It was carried with a facility offering a remarkable contrast to the difficulty of getting any sort of remedial measure through, and to the impossibility of passing the Appropriation Clause. Such proceedings very naturally confirmed O'Connell in his belief that the Irish had better be left to manage their own affairs in their own way; but his demand for the Repeal of the Union had no immediate effect beyond exciting a bitter feeling of hostility against England among the Catholic Irish, and increasing the discredit of the Whigs, obliged as they were to accept the Parliamentary support of the great orator who habitually referred to them in terms of calculated scorn and hatred.

O'Connell privately complained that the Liberals were infidels, which, according to him, alienated from them the sympathies of the Irish people. This was very ungrateful on his part, for had the Liberals inherited the religious convictions of their political ancestors, the English Puritans, they certainly would not have supported Catholic Emancipation, nor proposed the secularisation of Irish Church property. What delayed Emancipation so long was the religious bigotry of the English middle class; what enabled the Lords to reject the Appropriation Clause time after time was the knowledge that it excited no enthusiasm among the new electorate. We shall see hereafter that the much more sweeping secularisation carried thirty years later was only made possible by the weakening of religious animosities due to the spread of rationalism in the meanwhile.

A great instrument of enlightened legislation

had been created and used with brilliant success for realising ideas hitherto debated only within the schools of thought. But the men who wielded it could give neither education to England nor peace to Ireland, because they found themselves confronted by a force which served as a rallying-point for all the enemies of progress, and against which Bentham had flung himself three times in vain—the force of organised pietism, seeking to secure the greatest happiness of the greatest number in a world that is not ours.

Up to a comparatively recent period any Government that excited the hostility of the Church of England has been doomed to destruction. Both the Commonwealth and the Stuart monarchy had that misfortune, and both fell almost without a struggle. Even the genius of Marlborough could not uphold his friends when they dared to touch a parson. What overthrew the younger Pitt, and so long debarred the Whigs from power, was really the Church, acting through the stubborn will of George III. and the vacillating will of his successor. Wellington's fall was the Church's revenge for Emancipation; and now the Reform Whigs found themselves unequally matched against the same relentless foe. Russell's revival of the Appropriation Clause drove four of his colleagues into the Conservative ranks, Stanley, afterwards thrice Prime Minister, and Sir James Graham, an administrator of exceptional ability, being among the number. Their loss was soon followed by the retirement of Earl Grey. For want of a better chief, the incompetent Lord Melbourne had to be

put in his place. Nature had meant Melbourne for a scholarly mystic,[1] as she meant Lord Althorp, who led the House of Commons under him, for a grazier. When the death of his father, Earl Spencer, removed Althorp from that uncongenial position, the Ministry fell to pieces. The King, who sided warmly with the Church against Russell, if he did not actually drive them from office, at any rate claimed and received full credit for having done so. On Melbourne's resignation he sent for Peel, who at once dissolved Parliament. The Tories, who had counted no more than 150 in the first reformed House of Commons, won an immense number of seats, and probably would have won a majority had not the people resented the King's interference. A series of defeats in the new House compelled Peel to resign, and William IV. had to undergo the humiliation of recalling Melbourne to office. Parliamentary reform had given a mortal blow to the power of the Crown; but in its last agonies it exercised its old effect of weakening the real Sovereign. As a penalty for accepting its support, Peel, the true middle-class Minister and destined future chief, was condemned to six years more of opposition. The delay would have been shorter had not an untoward combination of circumstances allowed the royal influence to exert itself once more.

In 1837 the young Princess Victoria succeeded to the throne, and her accession was followed, in accordance with a rule since altered, by a dissolution of Parliament. The Whigs were rather

[1] See his character in Bulwer Lytton's *St. Stephen's.*

stronger in the new House than in the old; but the respite did not last long, and, after two years of weak government, Melbourne again resigned. Peel was again sent for, but made it a condition of accepting office that the great Whig ladies of the royal household should be replaced by attendants more in the confidence of his party. The young Queen, whose instincts were autocratic, showed on this occasion the temper of an Elizabeth, and declared that she would not give up her old friends. Parties were so nicely balanced that her will decided the question, and the Whigs came back, but thoroughly discredited, and with a position hardly better than caretakers for Peel and his Conservative followers. Appealing to the country from a vote of no confidence, and taking up at the last moment an insincere cry for cheap bread, they found themselves this time decisively beaten, and were condemned by a majority of ninety-one when the new Parliament met.

## Chapter VII.

# THE CHURCHES AND THE WORLD

While the events related in the last chapter were succeeding one another on the surface of history, a reactionary current had set in deeper down whose representatives were hardly more in sympathy with Sir Robert Peel than with his Whig and Radical opponents.

We saw how the Peace of 1814 was followed by a strong religious movement connected with the Methodist and Evangelical revivals of the previous century. So great, indeed, was the fascination exercised even on the intellectual classes that during the next twenty-five years young men of the highest and most varied ability were drawn to the Christian ministry in numbers such as had not been known since the Reformation; while even in the hands of laymen poetry and science received a distinctly religious impress, markedly contrasted with their treatment by the preceding generation. This religion had a strongly pietistic character; that is, it involved a constant reference to what was to come after death as infinitely more important than what was happening now, and a view of our present life as deriving its sole significance from the connection of what happened in it with what was to come after death. Among the more ignorant and excitable religionists, the study of what was supposed to be revealed in the Jewish and Christian Scriptures

stimulated still further their restless curiosity about a future state, and led to fantastic interpretations of ancient prophecies in the light of contemporary politics. Edward Irving, as we saw, owed his popularity to the address with which he put himself forward as the hierophant of such mysteries; and the original object of Keble's *Christian Year* was to appease the prevalent excitement by directing it towards more sober and profitable meditations.

If the millenarian visions of the religious revivalists were rooted in eighteenth-century pietism, they were no less intimately related to the revolutionary aspirations of the age. In the presence of absorbing social interests, the individual soul could no longer remain wrapped up in the contemplation of its own eternal destinies. Hence the prominence given to the social aspect of human immortality as a reign of the saints in the theology of the period. But the millennium itself had to be preceded and brought on by the conversion of the whole earth to true—*i.e.*, Protestant—Christianity, accompanied by the removal of whatever abuses still impeded that glorious consummation. Efforts in this direction demanded concert, union, organisation; and with the need of organisation came the need of a central authority. As the French Revolution had ended in the centralised despotism of Napoleon; as the Benthamite programme of reforms had substituted an undivided middle-class control for an incoherent oligarchy, and was enriching the administration with a number of new directing departments, so in various quarters efforts began to revive the idea of the Church, always an integral

element of Christianity, or rather to make it more of a reality than before.

We are accustomed to associate this idea in a rather exclusive way with the Tractarian Movement at Oxford; but the Oxford experiment was only one of a number, enjoying a unique success because it was worked on the basis of a solid existing institution. Irving founded a Church on the model of what he conceived the Apostolic community of Jerusalem to have been. His friend Coleridge, starting from the opposite pole of speculation, constructed the idea of a Church as a body holding in trust national property to be expended in promoting the interests of progressive civilisation. Such a Church need not be identified with any form of theological teaching; although, in the case of the Anglican establishment, the traditional dogmas, interpreted in the light of his own philosophy, might be allowed to live on as the centre of a vast system of culture. Dr. Arnold, of Rugby, who was in some ways a Coleridgean, meditated comprehensive schemes for uniting Churchmen and Dissenters in the same establishment, and English and Prussian Protestants in the same communion. James Mill, going further than Coleridge, proposed turning the endowed clergy from preachers of divinity into teachers of morality. Maurice, a Unitarian converted to liberal orthodoxy, and the most philosophical of all the young men that the religious movement had swept into Anglican orders, loved to exhibit Christianity on its social side as the Kingdom of Christ. Whately, the great Whig Archbishop of Dublin, strove for years to keep up a joint system of popular education

in Ireland, based on as much Christianity as could be taught in common to Catholic and Protestant children.

Among more conservative clerics the need of a stronger ecclesiastical organisation made itself primarily felt as a reaction against the rising rationalism of the age. What they called German neology—that is, scientific Biblical criticism—had begun to make its way from Hanover to England before communication between King George's insular and continental dominions had been cut by the war, and with the renewal of intercourse after the Peace the current had again set in. Rose, a High Church Cambridge theologian, sounded the alarm in a published course of lectures (1828) enumerating all the points on which German University professors had presumed to shake the faith of their classes in Scriptural infallibility. According to him, this lamentable heterodoxy was due to the abandonment of Episcopacy by German Protestantism. At Oxford, where nothing was then known of modern criticism, the triumph of Liberalism in English politics at first excited most indignation, and Peel lost his seat for the University by conceding the Catholic claims. Academic intolerance found an unexpected mouthpiece in Keble, the poet of the *Christian Year,* who had acquired great authority by his hymnology, by his learning, and by his saintly character. Chosen to preach the Assize Sermon at Oxford on July 14th, 1833, he took the opportunity of making a violent attack on what he called National Apostasy. Without actually naming the repeal of the Test and Corporation Acts and Catholic Emancipation,

while admitting even that such measures might be justified on grounds of political expediency, the preacher vehemently protested against the exultation with which such lamentable necessities had been hailed as in themselves a good thing. But there were worse signs of the times than even such deluded self-congratulations. There was a general tendency to look on a difference of religious opinion as of no account in the daily business of life, to repose public confidence in the heretic or infidel, and even to make a friend of him in private as readily as if he were an orthodox believer. There was also a culpable indifference to the authority of the clergy in matters of religion. Yet the Old Testament—which Keble treats throughout as an infallible record and guide—teaches a very different lesson. It tells us that statesmen should humble themselves before the accredited ministers of religion, and bow to their decisions as to the oracles of God.

In the Preface accompanying his published Sermon Keble specifies the Irish Church Bill, suppressing certain Irish sees, as the occasion that more particularly called it forth, denouncing as impious the State's pretension to interfere with the internal economy of ecclesiastical institutions. In view of the possible disestablishment of the Church of England he and his friends fell back on the supernatural character which, according to them, distinguishes it from all other Protestant bodies, if indeed it could properly be called Protestant at all. Their claim rested on Apostolical succession, on the alleged historical fact that the power to teach revealed truth and to absolve from sin descended

by an unbroken chain of ordination from Christ and his Apostles. It was determined to issue a series of Tracts setting forth this claim, and appealing in the first instance to the clergy, whose mystical pretensions, if asserted with sufficient emphasis, would surely enable them to recover their ancient dignity and power.

Such was the origin of the Tractarian Movement. It quickly passed from Keble's guidance into the hands of a far superior leader, John Henry Newman, beyond dispute the greatest pulpit orator of the nineteenth century, and, in the opinion of many, its greatest prose writer also. A singularly magnetic personality enabled his literary gifts to tell for quite as much as they were worth, and secured for him the implicit obedience of other adherents to the Movement whose intellectual powers, as measured by logical ability and justness of thought, were superior to his own.

Newman had begun as an Evangelical; and the religious position he subsequently adopted may be more properly described as an enlargement of Evangelical principles than as a reaction against them. None of his associates was so strongly impressed by the growing rationalism of the age; indeed, his intellectual sympathies with it were so strong as to draw on him a wholly unmerited imputation of secret unbelief. And he considered that neither Evangelicalism nor, indeed, popular Protestantism in any form had a good logical case as against infidel attacks. Heartily accepting the Bible as an infallible authority, he held that it needed the warrant of an infallible Church to be

accepted, and that any argument against the Church applied equally to the Bible.

Pusey, who afterwards gave his name to the Movement, was not drawn into it until some time after the publication of the Tracts had begun. His views had indeed been at first more liberal than Keble's or Newman's. He knew German, had travelled in Germany, and resented Rose's onslaught on the German theologians, some of whom were his friends. A pamphlet of his, written in their defence, seemed even to indicate some serious reservations about the extent to which Biblical infallibility should be accepted as of faith. But the remonstrances of his High Church friends soon put an end to such doubts, and henceforth Pusey gave his unfaltering support to the literal accuracy of every statement in the Old Testament, no less than to the dogma of a never-ending hell, as integral elements of Christianity. As for Keble, he held that most of the men who felt difficulties about Scriptural inspiration were too wicked to be reasoned with.

Among Newman's younger followers the most conspicuous were Hurrell Froude and W. G. Ward. Froude was a Romanticist, who hated the Reformation, and felt more enthusiasm for the mediæval than for the primitive Church. He urged Newman further along the reactionary path, but died before the alternative between insular and Roman Catholicism could be fairly presented to his choice. Ward, before he came under Newman's influence, had been a Broad Churchman of the Arnoldian school. As a keen dialectician, he convinced himself that Arnold's principles logically led to complete unbelief. It was easier to prove that Tractarianism,

when pressed to its legitimate consequences, involved complete submission to Rome; and Ward lost no opportunity of reasoning the matter out with Newman.

The Reformation had begun as a revolt against priestly authority, and had ended, in Calvinism, with the reduction to a minimum of the sacramental and ritualistic systems by which that authority is chiefly maintained. The Tractarian reassertion of sacerdotalism naturally led to a reversal of the process, to a resumption of the practices and beliefs which Protestant England had condemned as unscriptural and superstitious. Such a proceeding was not indefensible. It so happened that the formularies of the Anglican Church had been carefully constructed so as to conciliate that considerable body of Catholics, amounting probably to a majority of the whole population, who had separated from the See of Rome solely because on no other terms could the national independence of England be preserved. Nor was this all. In clearing away alleged mediæval corruptions the English Church Reformers had not trusted to their unaided private judgment. They had appealed to primitive doctrine and practice as evinced by the Fathers and the first great Councils. Their interpretation was not infallible; it was open to correction or completion from the researches of later scholars. By a skilful use of such methods Newman concluded that an Anglican clergyman might, consistently with his ordination vows, hold something very like the whole cycle of Roman doctrine as formulated before the Council of Trent. His contention provoked a general outcry, which

brought the Tracts to an end; and the charge of dishonesty was freely flung at him and his party. It came with an ill grace from Low Churchmen who on some points were departing not less widely from the plain sense of the formularies in the direction of Calvinism than their opponents were departing from it in the direction of Rome.

After long hesitation, Newman and Ward extricated themselves from this disagreeable position by submitting to the Church which the patristic researches of the one and the peremptory dialectic of the other had convinced them was the sole refuge from that utter unbelief to which unaided human reason is condemned.

So ended the Tractarian Movement. Oxford resumed her interrupted studies, and the current of free criticism so dreaded by Newman returned in greater force than ever. The Tracts had failed to effect the original purpose of their chief author; they had not persuaded the English clergy as a body to claim a position of commanding authority on disputed questions of belief; nor in a Church constituted like theirs was the claim possible, for no such authority can exist without a supreme head to issue and enforce its decrees. Besides, the Bishops showed no inclination to assume new responsibilities, nor would the majority of the clergy have accepted their guidance had it been offered. Many individual curates were not slow to plume themselves on their restored dignity as successors of the Apostles, though in their hearts they felt much prouder of being classed as English gentlemen; and celibacy was the very last feature of Romanism they were disposed to imitate. Such

as they were, this disorganised band of Puseyites, as they now began to be called, after their sole remaining Oxford leader, found themselves far outnumbered by the Evangelicals, to whom Apostolical succession was at best but an antiquarian curiosity, while the doctrines and practices associated with it by the new High Churchmen were objects of fanatical hatred and terror. Intellectually, after Newman's secession, the lights of the party could not compare with such divines as Milman, Whately, Hare, Thirlwall, and Maurice, soon to be reinforced by Arthur Stanley, Charles Kingsley, Robertson of Brighton, and Benjamin Jowett. Some of these were more than suspected of doctrinal heresy; none were sacerdotalists; all cherished the connection between the Church of England and the new Liberal State.

The Movement had begun as a protest against the ecclesiastical policy of the reforming Whigs. Three years afterwards fresh and more direct provocation was given by Lord Melbourne's appointment of Dr. Hampden to be Regius Professor of Divinity at Oxford. Hampden had been Bampton Lecturer in 1832, and had chosen the scholastic theology for his subject. The course he delivered was one long attack on the mediæval dogmatism that his dreaming contemporaries proposed to make the supreme law of belief. They now accused him of heretical views about the Trinity. His real offence probably consisted in throwing some doubt on the penal interpretation of the Atonement. Anyhow, a strong official protest against the appointment was got up, signed, it is said, by some who had not read the incriminated

lectures. Melbourne persisted in forcing his professor on the reluctant university authorities, who used their power to make Hampden's position as disagreeable as they could. Eleven years later Lord John Russell raised a fresh outcry by promoting him to the See of Hereford, carrying the appointment through against the protest of half the Episcopal Bench. Arnold, whose orthodoxy seemed more doubtful still, would probably have been made a Bishop if he had lived.

The logical course would have been for the High Churchmen to sever their connection with the State altogether. In Scotland this was the actual outcome of a somewhat similar movement. There the Evangelical revival took the form of a revolution in Church government. As religious zeal increased among the people, it was claimed that the congregations should be allowed, if they chose, to exercise a veto on the choice of their ministers. This was found to be inconsistent with the law as it stood, and every attempt to alter the law broke down. Finally, under the lead of the most distinguished living Scotch Churchman, the celebrated Dr. Chalmers, 474 ministers seceded from the Establishment, and set up a Free Church, supported by voluntary contributions.

But, although the Movement failed to accomplish the objects of those who first began it, their efforts were by no means thrown away. By provoking religious controversy they greatly raised the religious temperature of the upper and middle classes, thus contributing to that state of opinion which enabled the Lords to reject the Appropriation Clause and eventually drove the Whigs out of

office. And not only did the Church of England profit, like every other religious body, by this reinforcement of religious zeal, but it profited in a more special way by the reforming activity of the detested Liberal Government. During his brief tenure of office between Melbourne's first and second Administrations, Peel issued a Commission to ascertain what was the amount of the Church's revenues, and how they were distributed among her ministers. Its report brought to light the existence of scandalous abuses. Speaking broadly, the richest preferments fell to those who did the least work, or, in numerous instances, to those who did no work at all, while the hardest workers were the most miserably paid. Nearly half the beneficed clergy were non-resident, with the result that Dissenting chapels had nearly doubled in twenty-four years.[1] On the basis of this information Russell carried a series of measures putting an end to the most crying abuses, and establishing a less unequal proportion between the services rendered and the emoluments received.

Such legislation, excellent as it was, effectually blocked what would perhaps have been the more salutary course, recommended by the philosophical Radicals, of applying the surplus revenues of the Church to national education. Above all, by making the Church more popular it increased the power of the clergy to resist any comprehensive system of State education, which from the nature of things must have been unsectarian, like Lancaster's, or secular, like Bentham's.

[1] Walpole, *History of England,* vol. v., pp. 259–60.

Before clerical resistance to popular education could be even partially overruled, a new current of opinion operating against theological prejudice of every kind had to come into play. Two distinct forces, represented, however imperfectly, in Paine's *Age of Reason,* combined to swell its volume. There was the direct attack of rationalistic criticism on theological beliefs; and there was the indirect effect wrought by science in substituting the view of nature as an orderly, uninterrupted sequence of events, without any known beginning or end, for the supernaturalist view of the same events as emanating from a personal will, and subject at any moment to its interference for purposes best known to the guardians of accredited religious tradition, and occasionally disclosed by men and women believed to be in the confidence of that overruling will.

Many hold that democracy counts as a third force co-operating with criticism and science. But this seems to be a mistake, resting on incomplete historical studies or on accidental political experiences. A democracy where the people remain in ignorance is from the nature of the case rather favourable to the more simple and primitive beliefs of mankind, or, more generally, to whatever offers the greatest felicity at the cost of the smallest intellectual effort. Popular feeling may easily be excited against costly ecclesiastical establishments; but so also may the cupidity of a despot or an oligarchy; and, when pious benefactions have been given up to public plunder, the zeal that originated them returns, in default of diffused enlightenment, with equal facility under every form of government, and becomes the basis of fresh accumulations.

The rising influence of the people as such in English politics long remained associated with an increase of general bigotry; and it seems more than doubtful whether in the aristocratically organised Scottish society of the eighteenth century a sustentation fund of a million and a quarter could have been raised for the Free Church.

In fact, the transfer of power to a more extended section of the community registered by the Reform Act seems at first to have rather discouraged rationalistic criticism, and given a theological twist to scientific ideas. Thirlwall took orders two years after publishing his translation of Schleiermacher, nor did he make any other contribution to liberal theology. As tutor at Trinity College, Cambridge, he advocated the admission of Dissenters to the University, condemning also the collegiate lectures on divinity and compulsory attendance at chapel—pronouncements which led to the forfeiture of his academical position. After the outcry against his *History of the Jews,* Milman kept silence for ten years. In 1840, when the reaction seemed to be abating, he published a far bolder work, the *History of Christianity,* studiously minimising the miraculous element in the New Testament, and maximising the points of contact between the new revelation and the religious developments reached on various lines of unassisted heathen speculation. This time Milman's enemies were discreet enough not to advertise his heresies by such extreme vituperation as before; but their dangerous character was quietly pointed out, and the circulation of the book seems to have been effectually blocked. A little before its publication Charles Hennell, a

highly intelligent Unitarian layman, had handled the same subjects with much less learning, but with much greater freedom, in *An Inquiry Concerning the Origin of Christianity,* giving, indeed, no satisfactory solution of the problem, but impugning the miraculous narratives of the Gospel with such effect as to convince George Eliot, then a girl of eighteen, that the Evangelical view of religion she had adopted was not true.

The wide popularisation of physical science in England dates from 1831, the year when the British Association was founded. Several among its prominent teachers — Chalmers, Sedgwick, Buckland, and Whewell, for example—were clergymen ; and Faraday, the greatest of them all, sometimes conducted the religious services of the little sect to which he belonged.

Apart from the gratification of their own devotional feelings there were ample pecuniary rewards for those who, in the poetical language of Tom Moore, made "Science the torch-bearer to Religion." A pious peer, Lord Bridgewater, bequeathed £8,000 to subsidise Natural Theology ; and his executors fulfilled his intentions by dividing the money among eight men of science, four of them clerics, each of whom was paid to produce a treatise bringing evidence from his own particular study to prove the power, wisdom, and goodness of the Creator. One of these treatises, written by the Rev. Professor Buckland, an Oxford geologist, had an enormous circulation, and earned for its lucky author a handsome sum in addition to the Bridgewater fee of a thousand pounds. This was

in 1836. The author had made his reputation thirteen years before by a book called *Reliquiæ Diluvianæ, or Observations on the Organic Remains Attesting the Action of a Universal Deluge.* Such an event, had it occurred, would have proved more for the power than for the wisdom or goodness of its author; but, whatever might be its bearings on natural religion, the *Reliquiæ* was warmly welcomed as a support to revealed religion, whose authenticity seemed at that time to be closely bound up with the historical truth of a book where a universal deluge is recorded as having actually taken place not many thousand years ago. Buckland subsequently abandoned what he had once defended, and was bitterly assailed by his fellow-clergymen in consequence.[1]

However its relations with Scripture might ultimately be adjusted, geology was supposed to bring incontrovertible proof of the popular religious philosophy by its then accepted doctrine of Catastrophes. Cuvier, the great French palæontologist, taught that Noah's Flood came last in a series of great cataclysms, by which the living population of the globe was periodically cleared off, to be subsequently replaced by a new organic creation. Now, unless the earth were credited with a power of spontaneously generating plants and animals on the largest scale—and that such a power ever did or could exist seemed contrary to all experience—no alternative remained but to admit that God himself intervened on each occasion to fill up the void.

At a time, however, when this argument was being most confidently hawked about, the

[1] White, *Warfare of Science and Theology,* vol. i., p. 232.

hypothesis on which it rested had already received a mortal blow from the greatest living authority on the life-history of the earth. In 1830 Charles Lyell published his famous *Principles of Geology*. That work is one long argument going to prove that the known facts can be explained without the intervention of any such catastrophes as Cuvier demanded. The natural forces now in operation are enough to account for every past change in the climatic conditions and in the distribution of land and water on the earth's surface ever since it became capable of supporting life. There are no abrupt transitions from one geological period to another. All is orderly sequence, and at the same time all is perpetual change. Lyell still admitted that every new species represented a separate act of creation; but his uniformitarian theory made possible the subsequent theory by which the successive appearance of organisms adapted to altered environments has been interpreted as due to the unaided operation of natural causes.

Lyell privately described his theory as striking at the Mosaic cosmogony, but he avoided any public expression of hostility to the prejudices of the age. It is, however, reported on his own testimony, given long afterwards, that this reserve did not save him from social ostracism for having contributed, however indirectly, "to discredit the Pentateuchal accounts of the Creation and the Deluge" (Huxley). It is, at any rate, certain that ladies were excluded from his professional lectures at King's College, London, probably because his subject involved some adverse reference to the Mosaic cosmology. Mrs. Somerville was preached against

in York Cathedral, presumably for the same offence.

So much of the national energy spent itself on politics, religion, and science during the Reform era that less remained available for imaginative literature and history. Brief lyrics, brilliant review articles, and novels of episodical rather than concentrated interest were most in request among readers with little leisure, and most readily supplied by writers on whose time there were many other demands. *Pelham,* the novel that made Bulwer Lytton's reputation (1828), is a series of almost disconnected studies in life and literature, not a romance. Tennyson's earlier poems show vivid inspiration and careful workmanship, but no sustained constructive effort. In prose this was a great age of essayists, made illustrious by the names of Macaulay, Carlyle, De Quincey, J. S. Mill, and John Wilson. Carlyle's *Sartor Resartus* (1833–34) is not really a book, but a collection of unsystematic thoughts and disconnected images. The *French Revolution* (1837), indeed, is a great work of art, unequalled by anything that his contemporaries were then doing, or by anything that he himself did afterwards, for splendour, power, and unity; but it is an exception that proves the rule, being, in fact, a political pamphlet of the transcendent kind, the expression of a radicalism that would substitute, not individual liberty, but better and stronger government, for the rotten institutions of the past. The Lectures on *Hero-Worship* (1841) are generally supposed to represent Carlyle's leaning to autocracy as the only legitimate form of government. But, whatever their intention may have been, such is

not the moral they convey. With few exceptions the heroes are religious reformers, poets, men of letters, not men of action, exercising authority, not by force, but by persuasion. The two representative soldiers really serve as a warning against autocracy, for Cromwell totally fails to carry out his ideals in the absence of popular support; while Napoleon, possessing all that Cromwell wanted, has his head turned by uncontrolled dominion, deserts the democratic cause, and perishes by fighting against the laws of justice. Another marked trait of the Lectures is their silent, but probably not unconscious, hostility to the dreams of such enthusiasts for the mediæval Church as Hurrell Froude. Most of the heroes belong to Protestantism; the one mediæval Catholic, Dante, is only made interesting on the human and personal side, his theory of the world being dismissed as obsolete.

Carlyle's own religion at this time was a vague deism inherited from the previous century, combined with a particular hostility to the Tractarians for their attempt to rehabilitate superstition under forms more objectionable than any others to a Scotchman. Another Scotchman, George Combe, taught deism in a more undisguised form to a more popular audience in association with the alleged discoveries of phrenology. His idea of basing education and social reform on cranioscopy was a chimera; but he did good service by pointing to a healthy constitution of brain and body as the necessary condition of mental and moral improvement.

It is to be noticed how Scotchmen stood to the front in every scheme for benefiting the people by cultivating their intelligence. Besides his efforts

on behalf of State-aided education, Lord Brougham was the soul of the Society for the Diffusion of Useful Knowledge. The valuable publications of the Chambers brothers obtained a wide circulation in England as well as in Scotland; and George Birkbeck, the founder of Mechanics' Institutes, himself a Yorkshireman, owed his enthusiasm for popular education to a prolonged residence in Scotland.

Such enterprises as Brougham's and Birkbeck's, beneficial as they were to the middle classes, left the mass of the labouring population untouched. For them the question was not how to live well, but how to live at all. Brougham had, rather pedantically, hoped the time might come when every cottager would read Bacon. Cobbett observed, with pertinent wit, that he had much rather see every cottager eat bacon. But the one wish seemed nearly as Utopian as the other. A cottager supporting himself, a wife, and five children on from seven to ten shillings a week had much difficulty in providing bare bread, with corn ranging from fifty to seventy shillings a quarter. Factory hands were better paid, and altogether the condition of the people had improved since the Regency; but their poverty was pitiable, and distress continued to be much aggravated from time to time by a bad harvest or a commercial crisis. The Reform Act had put an end to some great evils; but others remained unabated, and the decline of political excitement left public opinion more free to occupy itself with these. We shall see in the next chapter what ideas, more or less practical, more or less permanent, responded to the social demands of the age.

## Chapter VIII.

## IDEALS AND REALITIES

Of all schemes for the regeneration of mankind put forward during the Reform era, the most ambitious and far-reaching originated with Robert Owen (1770–1858). This man had raised himself by genius and conduct from the position of a petty trader to be the head of a great manufactory, and had relinquished that position in order to carry on a world-wide propaganda for his favourite ideas. He may be described as the father of modern Socialism. But his proposals for collective ownership differed widely from the State socialism of more recent times. For their realisation he looked not to government intervention, but to experiments in voluntary co-operation, aided to any extent at first starting by private or public munificence, in the confidence that, once started, they would prove self-supporting, and by successful competition would gradually free industry from the control of individualistic capital. As the foundation of the new social order he devised, and for several years actually put into practice among his own work-people at New Lanark, a peculiar system of education and discipline which replaced the study of words by the study of things, and the use of rewards and punishments by the use of moral suasion. Believing character to be the creature of circumstance, he held that to inflict pain on people

for what they could not help doing was unjust; but, as his methods proved perfectly successful at New Lanark, they might have been defended on grounds of simple expediency, without the intervention of metaphysical abstractions. In fact, Owen's personal magnetism, falling in with the grateful enthusiasm of the Scottish character, exhibited a happy coincidence not to be reckoned on by ordinary educators and rulers, nor even by such experts as Dr. Arnold of Rugby, who, we are told, did not govern by love, but by fear.

Owen ultimately gave up his position at New Lanark for the office of a public agitator, which he was much less fitted to fill. Believing in no existing religion and adhering to no recognised political party, his faith in Co-operation was such that, like some more recent reformers, he dreamed of combining all schools in the support of his educational and communistic schemes. As a natural consequence, the rest of his active life was spent in spinning ropes of sand. Men of the most discordant views—Archbishops and atheists, Radicals and reactionists—were induced to promise their support; but it never went beyond promises. Some important movements—Secularism, industrial co-operation, profit-sharing—may be traced back to his initiative; but these lie off the central line of English evolution as it was being unrolled when Peel came into power.

Chartism was of far more immediate practical importance than anything Owen ever said or did. It may be described as the resumption in a more systematic way of the agitation for Parliamentary

Reform begun under the Regency and temporarily arrested by the Whig measure of 1831–32. A document called the People's Charter, drawn up in 1838, put the extreme democratic claims into shape. Taken in the order of their importance, its articles were: Manhood suffrage, equal electoral districts, vote by ballot, annual Parliaments, abolition of the property qualification at that time required for members of the House of Commons, and instead thereof payment of them for their services. The leaders of the movement are deservedly forgotten, nor need their names be recorded here. The Chartists were as much inferior to Chartism as Owen was superior to the Owenites. They were, in truth, quack doctors drawing attention to a dangerous disease, and so winning a sort of confused sympathy from literary people, not always much more practical than themselves — Wordsworth, Carlyle, Harriet Martineau, and Benjamin Disraeli. Carlyle took hold of the agitation as a good stick to beat Benthamism with. But his own proposals for remedial legislation did not go beyond education and emigration. The one was advocated by every Benthamite, the other by J. S. Mill, the young chief of the school, from whom he had probably picked it up in conversation. Carlyle also gave a gruff approval to the new Poor Law, which the Chartists hated. Wordsworth, in whom the old revolutionary passion had never died out, preferred them to the Whigs, against whom Disraeli also hoped for their aid.

Macaulay put the Whig case against Chartism —which, in this instance, was the case of all sensible people—in one short speech with crushing

effect. According to him, the only demand of supreme importance was manhood suffrage. To grant that would be to place all the property of the kingdom at the mercy of men who proclaimed their intention of confiscating it if they gained the control of Parliament. He pointed out that, among the grievances which those who petitioned for the passing of the People's Charter expected to be redressed, payment of interest on the National Debt was expressly mentioned; and that the monopolies of machinery, of land, and of the means of travelling and transit were also quoted as injustices to be removed. Whence he concluded that to pass the Charter would bring irretrievable ruin on the country.[1]

As against the petitioners this reasoning was conclusive. But our experience of universal suffrage elsewhere has not gone to confirm Macaulay's gloomy anticipations of its probable effect if introduced into England. Where the voters are educated they have too much honesty and good sense to ask for the confiscation of private property. Where they are ignorant they go to the poll in disciplined masses at the bidding of party managers whose desire is rather to secure lucrative offices for themselves than to propose a general scramble for the instruments of production in which they might probably be crushed to death. If by a miracle the Chartist agitation had succeeded, the result might well have been a more complete victory for the reactionists than was won in 1841.

[1] Macaulay, *Miscellaneous Writings and Speeches,* vol. iii., p. 186.

Among the literary sympathisers with Chartism the name of Disraeli has been mentioned. Sympathy, as attributed to him, must not be understood in an emotional sense, for his attitude in reference to the Turkish atrocities forty years later proves that human suffering on a large scale left him absolutely callous. But he saw that, as opinion then set, to expatiate on the wrongs of the labouring poor was a convenient method for acquiring notoriety and power. For the rest, both then and afterwards he failed conspicuously, for one so clever, in forecasting the general trend of progressive ideas. A sort of dandified romanticism playing at the resuscitation of mediæval institutions in Church and State had been the fashion in his youth; and now in the late thirties, when it was waning before the light of science, Disraeli took it up in the spirit of a secondhand broker as a means for the reconstitution of the Tory party. A people maddened with hunger were invited to seek deliverance by rallying round the old aristocracy, the throne, and the altar. Owing to the exigencies of sentimental fiction, Scott and Bulwer Lytton had chosen very young men for their heroes; and Scott's youths, at least, were habitually associated with great affairs of State. Therefore, according to Disraeli, the country and its institutions were, in some mysterious way, to be now saved by its youth. Hence the party formed on his principles became known by the name, or nickname, of Young England. Whether the juniors were to be chiefly employed in the education of their elders, or in what is now called slumming among the cottagers on their fathers' estates, did

not seem clear. On no important political question could the Young Englanders be got to act together, not even on the maintenance of the Corn Laws, which Disraeli himself considered essential to the predominance of the landed interest, and therefore to the salvation of England. To stake the cause of the aristocracy on an odious food-tax showed a singular want of political sagacity in one who was negotiating an alliance between the nobles and the people.

A still greater blunder, if possible, was Disraeli's proposal, borrowed from Bolingbroke, to revive the power of the Crown. This, as Canning and Peel had foretold, proved incompatible with the authority exercised by a truly representative House of Commons; and neither the last independent political act of William IV. in sending for Sir Robert Peel, nor the first political act of the young Queen in refusing to accept Peel's terms, had tended to make royal interference more popular than before.

Disraeli and his young friends seem to have agreed in thinking that they could win over public opinion to recognise the Church of England as a body invested with theocratic powers. No idea could well have been more chimerical. It ran counter to all the traditions of English statesmanship. And the failure of the Tractarian Movement showed it to be particularly ill-timed at that moment. By making national education impossible the Church as a corporation proved herself the people's worst enemy; and the new science was rapidly paralysing her hold on the educated intelligence of the country.

It is remarkable how closely Disraeli, himself a Jew, agreed with Keble in resting the Church's theocratic pretensions on the authority of the Hebrew Scriptures; how they both dreaded Biblical criticism; and how the apostle of Young England gibes at the doctrine of evolution in *Tancred,* his religious romance of 1847, no less scornfully than in his address to the Church Congress of 1865.

Finally, after all these dissolving dreams, we come to the only movement of the late thirties that was practical, progressive, successful, and permanent. This was the agitation for the free importation of corn, conducted by the Anti-Corn-Law League, and associated for ever in the memory of Englishmen with the name of Richard Cobden.

The part played by Cobden and the League in their campaign against the Corn Laws has somewhat interfered with a right apprehension of the history of Free Trade in England. Cobden, of course, condemned all commercial restrictions on principle and as a matter of policy for his own country and for the whole world. But he was not the first by a good many to preach that principle in its entirety, or to make it the keynote of a successful policy. Plato, who created political economy, also held that imports should be untaxed; the French physiocrats, Adam Smith, and Ricardo placed his *aperçus* on a scientific basis, after whom came statesmen like Shelburne, Pitt, Canning, and Huskisson to carry them into practice. It happened that the new policy of more or less

withdrawing artificial protection from native industry was applied in the first instance to manufactures, because England, as a great corn-growing country, did not need to import foreign grain. Agriculture did, indeed, receive what was called protection; but this took the form of giving bounties on the exportation of corn. It was hoped that the bounties, by creating an artificial dearth, would raise prices at home; but as they stimulated production the actual effect was that prices fell. The importation of foreign corn had indeed been prohibited since the time of Charles II.; but, as plenty generally prevailed, the prohibition was not felt as a grievance.

With the industrial revolution and the rapid growth of population a change set in. Prices rose with the new demand for food; and a series of laws passed in the interest of the landowners pushed up the limit on the sliding scale of scarcity until foreign wheat was practically refused admission so long as English wheat stood at less than eighty shillings a quarter. To admit it even then hardly relieved the distress; for in the uncertainty of finding a market the foreign grain-merchants did not care to lay in stores which England might or might not be pleased to buy.

It was thought that a real representation of the people would put an end to such exactions; and the distress during the early years of peace produced, for the first time, a widespread demand for Parliamentary Reform. Liberty, in Shelley's phrase, meant—

> Clothes and fire and food
> For the trampled multitude

—a reason the more why it should be refused by the men in power. In other directions, however, concessions were made to the industrial interest even by an unreformed Parliament. Taxes on the raw material of manufactures were partially repealed, and reciprocity was substituted for the restrictions formerly placed on foreign shipping, while the duties on imported manufactures were vastly reduced. This was done by a nominally Tory Ministry. The Whigs of 1830 were Free Traders in theory; but they had neither leisure nor ability to do anything beyond reducing the paper duties. A series of good harvests postponed the Corn Law question for some years longer.

So matters remained until the terrible distress of 1837, continued and aggravated through the next five years, made the condition of the people the one all-absorbing interest of politics and literature. Owenites, Chartists, Young Englanders, agitators for the repeal of the new Poor Law, agreed in assuming that there was wealth enough in the country to afford a comfortable subsistence all round if only it were better distributed, by private or public charity, or by voluntary or compulsory Socialism. The scientific economists alone showed how the national wealth could be both increased and better distributed by granting complete Free Trade. According to them, the Corn Laws did mischief in more than one way, directly by raising the price of bread, indirectly by checking our foreign trade and diverting capital from investments where it could be turned to the best account to investments where it was turned to the least account. At home capital was diverted from the

manufacturing industries in which we excelled all other nations to agriculture, where, by the law of diminishing returns, not only was there less profit to begin with, but that profit was always growing less and less for equal amounts of capital expended on the soil. Abroad the reverse process obtained. The nations which would gladly have grown more corn wherewith to buy our cloths and calicoes, finding that we refused it, built factories of their own and set up prohibitory tariffs to guard their new industries against our cheaper goods. It was contended that the repeal of the Corn Laws would enlarge the field of employment for English labour and capital by giving a new stimulus both to the import and to the export trade.

The Protectionists did not deny all this, but they argued that to make England dependent on foreign countries for her food-supplies would be most hazardous; that to draw the peasantry away from the country to the towns would injure the national physique; that to lower the price of corn would be to lower rents, which was an act of confiscation—at the expense, too, of the class to whom England owed all her greatness.

To keep the people in a chronic state of want and misery seemed a rather costly insurance against the risk of future famine in the highly improbable contingency of our being at war with all the corn-producing countries of the world at the same time; and the middle classes, whom Reform had made sovereign, believed that they, rather than the noble lords who called robbery property, were the brain and backbone of England. Their wealth and energy had, in fact, brought us safely out of the

wars undertaken and misconducted by the ruling territorial aristocracy. And the literary leader of Young England, the political bravo of the high Tory party—Disraeli—himself admitted that the condition of the agricultural poor was even worse than that of the factory operatives.

So stood the balance of argument. In Parliament, and probably in the country, the balance of opinion stood heavily against Free Trade. But the progress of Liberalism had removed the restrictions by which reason used to be prevented from turning itself into public opinion, and had created a machinery by which the opinion of the people could turn itself more rapidly into the opinion of Parliament. In 1836 an Anti-Corn Law Association was founded in London by some Benthamites, and another of the same name two years later at Manchester, which in 1839 became the Anti-Corn Law League. This body carried on an agitation of unexampled magnitude all over the country, collecting enormous sums of money, assembling crowded meetings to hear addresses in favour of Free Trade, disseminating Free Trade pamphlets and leaflets by tens of thousands, prompting the acquisition of electoral qualifications by Free Traders, contesting Protectionist votes on the register, fighting Protectionist candidates at by-elections, making Free Trade motions in Parliament, appealing, and at last not in vain, to the all-powerful Prime Minister, Sir Robert Peel, to repeat what he had done for Catholic Emancipation, sacrificing the interests of his party to the interests of his country, which this time were the interests of all mankind.

At what precise date Peel's conversion to complete Free Trade took place is uncertain, and of no interest to anyone but his biographers. His adherence to Protection had long been avowedly a matter more of expediency than of principle. His first Budget embodied a rather complicated arrangement, which had the effect of lowering the corn duties to one half of what they had previously been; and this was accompanied by a large remission of protective duties on manufactured articles. Three years later, by a comprehensive scheme of Tariff Reform in the true sense, 430 articles were relieved of import duties, and all duties on British exports were repealed.

Disraeli at first applauded Peel for taking up what he then chose to describe as the genuine Tory policy—the policy of Pitt. When the Conservative Administration of 1841 was being formed he had applied for office, and had been refused. Perhaps he still hoped to conciliate the Prime Minister by this unexpected support. If so, he was mistaken. Then he turned to the extreme Tories, who were becoming mutinous at the growing liberality of their middle-class chief. They had another grievance besides the reformed tariff. In 1845 Peel proposed and carried an augmentation of the grant to Maynooth, a training college for Irish Roman Catholic priests. Judged by the ideas of that age, it was a statesmanlike measure, and it received the support of Cobden and Macaulay. But to subsidise the priests agreed better with Whig than with Tory traditions; nor could such a grant have been carried against the No Popery wing of the Conservative party without the aid

of Liberal votes. Then the unscrupulous and desperate adventurer saw and seized his chance. In a series of speeches unrivalled for picturesque sarcasm, Disraeli taunted Peel with having stolen the Whigs' clothes while they were bathing, with treating the landed interest like a cast-off mistress, with turning Conservatism into an organised hypocrisy. The Prime Minister's mind was one vast Appropriation Clause; he resembled the Turkish Admiral who steered his fleet right into the enemy's port. After the most virulent of these attacks Peel asked why, then, had the honourable gentleman wished to serve under one of whom, by his own account, his opinion had always been so bad. Disraeli replied that he had never made any such request. Sir Robert quietly repeated his assertion, but refrained even in that emergency from producing the written evidence of his treacherous assailant's falsehood; and the damning letter remained unpublished until nearly half a century after his death.

Stuart absolutism received its mortal blow from the Irish insurrection of 1641. Irish agitation broke up the reactionary Toryism of Peel's youth. Irish famine was now to ruin the Protectionist Conservatism of his triumphant prime. Our unequalled aristocratic government, which made the Irish bigoted Romanists in the seventeenth century, and destroyed Irish manufactures in the eighteenth century, had in the nineteenth century completed its fatal work by the utter degradation of Irish agriculture. For want of any other outlet the whole industry of the country was thrown on the

land; and the landlords, in order to multiply the electors who voted at their dictation, had subdivided the land among the greatest possible number of tenant-farmers holding their little plots at a rack-rent. These men had no capital and no motive to improve the land, as their improvements, if any, were liable to confiscation under the form of an increased rent. Many landlords lived away from their estates, delegating their authority to merciless agents, or letting them out in large farms on leases to middlemen who sublet them to a swarm of tenants-at-will, living themselves like gentlemen on what they could extract from these miserable serfs. As a means of subsistence the peasants were given a small piece of land, on which they raised a scanty crop. Potatoes were the food that could be grown in the greatest abundance with the smallest amount of labour. Potatoes accordingly became the staple food of the people. The system resulted in a rapid growth of population, thus increasing the competition for land and placing the poor more and more at the mercy of the rich. Those who could not pay their rent were turned out on the highways to starve. Until 1838 there was no Poor Law for Ireland; the system then introduced did not sanction the distribution of outdoor relief, and the workhouses had not sufficient accommodation for the mass of pauperism thrown on them in times of distress.

A Commission appointed by Peel "to investigate the conditions on which Irish land was held" reported in favour of compensating evicted tenants for improvements made by them with the permission of authorities appointed for the purpose; and a

measure giving partial effect to its recommendations was laid before the House of Lords in 1845, but excited so much opposition on the ground of invading the rights of property that it had to be withdrawn almost without discussion.[1] Apparently the Young Englanders had not educated their fathers up to the point of enabling them to see on which side, in this instance, as in the instance of the Corn Laws, the rights of property were to be found.

A people so circumstanced and thrown for subsistence on a single esculent are exposed to famine whenever, as frequently happens with the potato, their staple food is ruined by bad weather or by disease. The autumn of 1845 was rainy, and a new form of blight destroyed the potato crop. Free importation of corn became a necessity. Lord John Russell, who had hitherto advocated a fixed eight-shilling duty on foreign corn, now, by a public declaration, committed the Whig party to Free Trade. Peel had already been converted by Cobden's exposure of the miseries that Protection entailed on the English agricultural population. He proposed the immediate suspension of the Corn Laws, to be followed by their gradual abolition. At his first Cabinet Council all but three members dissented ; at the second, held in December, all but two agreed. What made the services of those two indispensable does not appear ; but anyhow Peel resigned. The Queen sent for Russell, who accepted, but failed to form an Administration, for the very odd reason that Lord Grey, the Reform

[1] Spencer Walpole's *History of England,* vol. v., p. 127.

Minister's son, had to be included, and that he would not sit in the same Cabinet with Lord Palmerston, who could not be left out. Peel returned to office, having in the meantime converted one of his late recalcitrant colleagues. The other, Lord Stanley, remaining obstinate, was replaced by W. E. Gladstone. At that time the future Liberal leader sat for a nomination borough in the gift of the Duke of Newcastle. The Duke now handed it over to a Tory, at the same time ousting his own son, Lord Lincoln, Peel's Irish Secretary, from the representation of South Notts. Lincoln remained out of Parliament for three months, and Gladstone for eighteen months. This was the same Duke that justified his eviction of tenants who voted against his candidates by asking had he not a right to do as he liked with his own. The Dukes of Richmond and Buckingham pursued a similarly obstructive policy in preventing Free Trade Ministers from retaining their seats. So much for the claim to altruism put forward on behalf of the landowning oligarchy by its modern apologists.

Peel did not introduce immediate or complete Free Trade. He proposed to retain for the next three years a duty on foreign corn varying inversely as the home price from ten to four shillings per quarter, after which it was to remain fixed at a shilling per quarter. Duties on manufactured goods were reduced from twenty to ten per cent., and on half-manufactured goods to five per cent., while the duty on raw material was entirely abolished. Abolished also was the duty on live stock and dead meat; the duties on butter, cheese,

and hops were lowered fifty per cent.; the differential duty against slave-grown sugar still continued, but in a diminished amount, as likewise did the duties on timber and tallow.

In the speech that introduced these great changes Peel touched on the question of reciprocity, or what is now called Fair Trade. He explained that his own policy had been adopted in complete independence of what foreign countries were doing or would do. He admitted that since our departure from Protection their tariffs, instead of being lowered, had in some instances been raised against English goods. But he parried this consideration by the fact that during the same period our export trade had increased. And he used the one fact to explain the other. The Protectionist countries were injuring themselves by their system of exclusion, and therefore their manufacturers could not resist the competition of our less fettered industry.[1] That our example would eventually tell on their governments he did indeed believe, but without staking his credit on the fulfilment of that prediction. And had a vision of the world's industrial history for the next sixty years unfolded itself before his gaze, we have no reason to think that the great Minister would have gone back on his adhesion to the principles of the Anti-Corn Law League. Precisely the same remark applies to Cobden. He anticipated a coming era of universal Free Trade. But he never argued for the abolition of the corn tax on the ground that it would be followed by a world-wide economic revolution, or

[1] Sir Robert Peel, *Speeches*, vol. iv., p. 601.

hinted at an admission that England would be worse off than before if other countries refused to follow in her footsteps.

It has been asked why Free Trade did not immediately lower the price of corn. The fact is so; but we must remember that the harvests for some years previously had been exceptionally good, and that the cheapness thus introduced was at least maintained; that a quite appreciable duty continued to be levied until 1849; and that foreign corn-growers needed some time to make arrangements for supplying the English market. When sufficient time had elapsed for the new demand to operate the price fell to an unprecedented extent.

Peel's Budget was carried by a coalition of Conservative Free Traders and Liberals, the House of Lords not daring to resist. But that victory was his Trafalgar. On the night when the Corn Bill passed the Lords his Ministry fell before a factious combination of Liberals and Protectionists in the Commons. English misgovernment had led to famine in Ireland, famine to outrage, and outrage to a new Coercion Bill, one article of which rendered any person found out of doors at night in a proclaimed district liable to transportation. At this time the Conservative party had split into two. Less than a third followed Peel; the others, who still clung to Protection, placed themselves under the leadership of Lord George Bentinck, an ignorant racing man with a head for figures, who allowed himself to be made the tool of Disraeli's ambition, while at the same time he gratified a relentless thirst for vengeance on one whom he believed to have been the cause of his

kinsman Canning's death. Bentinck and his followers had voted for the first reading of the Coercion Bill; they opposed the second reading on a frivolous pretext, and by combining with those who had resisted it from the beginning placed the Government in a minority of seventy-three. Peel resigned, and was succeeded by Lord John Russell at the head of a purely Whig Administration, including Grey and Palmerston, who by this time had contrived to make up the difference that had been found insuperable only six months before.

The Free Trade question introduced new lines of party cleavage on the Liberal as well as on the Conservative side. Some Whigs—Lord Melbourne among the number—believed in Protection. Some of the ablest Tories—Gladstone for one—followed Peel when he forsook it. The Benthamites, who had been the first Free Traders, were more or less Freethinkers, and so as a rule were the Foxite Whigs. The League habitually appealed to Christian charity against the policy of commercial restrictions, and its three greatest orators were men of deep religious conviction, combined, it is true, with very liberal religious opinions—Cobden, the most persuasive, as a Churchman; John Bright, the most powerful, as a Quaker; W. J. Fox, the most brilliant, as a Unitarian minister. The Anglican clergy were Protectionists almost to a man; Thomas Spencer, Herbert Spencer's uncle, being one of the very few exceptions. This seems to have been due to their connection with the landlord class. The Wesleyan ministers, from whatever reason, held the same opinions. But a great

conference of Nonconformist ministers assembled at Manchester in 1841 passed resolutions condemnatory of the tax on corn, as did also similar conferences at Edinburgh and Carnarvon.[1] This association of Nonconformity with Liberal politics has probably contributed to its subsequent development on lines of increased dogmatic liberality.

Another consequence of the Free Trade movement was the growing identification of Radicalism with a policy of peace, non-intervention, and disarmament. There had been a connection of the same sort before, but it was rather accidental than essential. The wars with America and with the French Republic had been or had looked like wars against popular government; and the war with Napoleon, although fought partly in self-defence and partly on behalf of European liberty, had contributed to the aggrandisement of the plutocracy in England. A great change took place with the revolutionary movement of 1820, as a consequence of which England under Canning definitely took sides with the cause of free nationalities in Europe and America. This made Liberal opinion more favourable to armed intervention in the affairs of other countries, while absolutist Tories, with Wellington at their head, advocated a policy of neutrality and strict respect for treaty rights.

Among the Canningites who coalesced with Lord Grey in 1830 the ablest and most vigorous was Lord Palmerston, who held the post of Foreign Secretary with a break of only a few months down

[1] Molesworth, *History of England,* vol. ii., p. 216; Morley, *Life of Cobden,* vol. i., p. 232.

to the Whig defeat of 1841. He steadily carried on the tradition of his old chief, extending the power and prestige of England by the support he gave to constitutional government in Belgium and Southern Europe, by his resistance to French and Russian ambition in the Near East, and, more questionably, by his aggressive action in the Far East. His greatest successes were won by diplomatic pressure, with the help of very little fighting. But his Turkish policy, brilliant as it was, had been carried out at the risk of war with France and with the certainty of prolonging for an indefinite period the blighting tyranny of the Sultan over some of the fairest regions on the globe. Its immediate success proved highly prejudicial to our own interests in Asia. For, as a counter-move to Palmerston's opposition on the Bosporus, Russia raised up enemies against us in Afghanistan ; and, finally, the blundering of the Indian Government brought on a war with that country signalised by the most frightful disaster that has ever befallen a British army, the annihilation of Elphinstone's force in the Khyber Pass.

While these deplorable events were happening on the north-west frontier of India we were carrying on a still more disgraceful war with China. When the Charter of the East India Company expired, in 1833, the Chinese trade was thrown open to all British merchants, and many of them used the opportunity thus offered to introduce large quantities of opium into China, although its importation was forbidden by the Chinese Government. As might have been expected, collisions of a more and more violent character occurred between the

officials on both sides; and, although Lord Palmerston gave orders that the Emperor's prohibition of the traffic in a pernicious drug should be respected, they were not obeyed. Finally, the Chinese Commissioner in Canton insisted on the surrender and destruction of all the British opium in China, valued at some millions sterling. Unfortunately, a part of the Indian revenue, too large to be spared, depended on the opium monopoly, and the value of this again depended on keeping the Chinese market open. Our people treated the destruction of the smuggled opium-chests as an outrage to be avenged by war, and war accordingly ensued. After some years of fighting, chequered by the usual disasters, it ended with the submission of our helpless opponents. China had to pay compensation for the opium destroyed and a heavy indemnity besides. Certain ports were opened to British trade, and, although the importation of opium was not yet legalised, no very energetic resistance to it could be expected from the Chinese authorities after such bitter experience of what came from meddling with its freedom.

At the conclusion of peace Lord Ashley, whose acquaintance we have already made as a defender of the defenceless, wrote in his private journal: "It may be unpatriotic, it may be un-British, I cannot rejoice in our successes; we have triumphed in one of the most lawless, unnecessary, and unfair struggles in the records of history." Next year he moved a resolution in the House of Commons condemnatory of the trade in opium as, among other evils, "destructive of all relations of amity between England and China," but withdrew his

motion at the entreaty of Sir Robert Peel, who "indulged in a deprecatory argument of which the gist seemed to be that, as we could not put down gin at home, we need not concern ourselves about introducing 20,000 chests of opium into China every year."[1]

In 1836 Cobden had published a pamphlet criticising Palmerston's policy of supporting Turkey against Russia, and generally advocating the principle of non-intervention. We do not hear that he or Bright took any part in opposing the Afghan and Chinese wars, or that they supported Lord Ashley in his attack on the opium trade, probably because all their energies were then absorbed in the Free Trade struggle. When Free Trade triumphed those energies became available for a wider policy, and the late chiefs of the League proved, by their opposition to the Russian war and the second Chinese war, that the principles of international justice and peace had become an integral part of their creed. They valued trade, but not the extension of trade by violence and chicane.

It was not only in the Levant, in the Far East, or in Ireland, that the interests of justice and mercy collided with the interests of national vainglory or plutocratic greed. I have already touched on the history of factory legislation, and in that connection I have shown with how little truth an exclusive claim has been set up on behalf of Toryism for the merit of intervening to protect the helpless sufferers

[1] Hodder, *Life of Lord Shaftesbury*, vol. i., p. 475.

against their taskmasters. Lord Ashley complained with reason of the extent to which the Whig Government of 1833 had limited his scheme for the prohibition of child-labour in factories, and again in 1836 of the imperfect way in which the law actually passed was allowed to work. But Peel had not been long in power before the great philanthropist discovered that less was to be hoped for from him and from his colleagues than from their predecessors. "This Government," he writes in his private diary, "is ten times more hostile to my views than the last, and they carry it *(sic)* out in a manner far more severe and embarrassing."[1]

In August, 1840, Ashley obtained a Commission to inquire into the employment of children in mines and collieries. Its first report appeared in May, 1842, unveiling a mass of misery and depravity that left the evils of factory labour far behind, and approached the horrors of the African slave-trade. The Home Office tried, but failed, first to keep back the report, and then to prevent its sale. This time public opinion was fairly roused, and Ashley's Bill to forbid the labour of women and children in coal-pits passed both Houses in the same Session, unsupported by the Government, received with coldness by the Lords, and nearly wrecked by their amendments, one of the worst being due to the Marquess of Londonderry, a high Tory peer.

By an Act passed in 1844 children were forbidden to work in factories under the age of nine, and to work for more than six hours and a-half a day under thirteen. Ashley proposed a ten-hour day

[1] *Life,* vol. i., p. 409.

for young persons from thirteen to twenty-one, but failed to carry his amendment. His supporters were mostly Conservatives, whom we may not uncharitably conjecture to have been in some degree animated by hatred of the manufacturers; but he also carried with him such representative Whigs as Russell, Palmerston, and Macaulay. By his own account, his "strength lay at first among the Radicals, the Irishmen, and a few sincere Whigs and Conservatives."[1] Members of the League suspected the sincerity of a philanthropist who voted for taxing the people's bread, and who showed no interest in the woes of the labourers on his father's Dorsetshire estate. Lord Ashley set himself right with the Free Traders by accepting total repeal, but lost his seat in consequence, and remained out of Parliament for years. During his absence the conduct of the Ten Hours Bill was entrusted to John Fielden, a cotton manufacturer, a Radical, and a Unitarian. After one more defeat it passed both Houses by large majorities in 1847, many Conservatives, according to Ashley, taking this opportunity of revenging themselves on Peel and the League.[2] Further legislation in 1850 and 1853, carried by Liberal Ministers, gave fresh protection to women and children against overwork. The same principle has since been more widely extended and safeguarded with the co-operation of both parties, and individual statesmen who were once opposed to it have admitted that they were mistaken. That the Tories should claim this as a triumph for themselves is even more

[1] *Life*, vol. ii., p. 209.

absurd than their now abandoned claim to the championship of Free Trade. Both are particular applications of Bentham's supreme principle—the greatest happiness of the greatest number—which no single rule either of interference or of non-interference can exhaust.

Lord Ashley complains that at first only a single minister of religion supported him, and even to the last very few.[1] He is distressed and puzzled "to find support from infidels or non-professors; opposition or coldness from religionists or declaimers." He points out that in the war with Scinde (1842) all the bad faith was on the side of the Christian conquerors, the vain appeals to justice on the side of the Mohammedan Ameers,[2] as previously, after the Opium War, that "Christians had shed more heathen blood in two years than heathens had shed of Christian blood in two centuries";[3] hears also with disgust that "many persons of *piety* defend and practise slavery" in America.[4] Yet, according to him, the salvation of the English poor depended on their being given a religious education, and a dogmatic one at that. Sir James Graham's abortive Factory Bill of 1843 contained provisions, more or less compulsory, for the education of the half-time children, the schools to be mainly under clerical control. Dissenters and Roman Catholics not unreasonably objected to a scheme for practically handing over the factory children to the tuition of the Church of England. Graham sought to con-

ciliate them—vainly, as the event proved—by directing that Bible teaching should be limited to reading the text, without note or comment. For the sake of peace, Ashley accepted this arrangement, but described it as "leaving a Socinian in Socinian ignorance, and a Socialist in Socialist impurities," and spoke of himself as feeling "a nausea almost to faintness" at having to gulp it down.[1]

Lord Ashley was, for an Evangelical, exceptionally statesmanlike and tolerant. But, besides objecting to simple Bible teaching, he passionately opposed Peel's increased grant to Maynooth College, and in this he not only represented the opinion of Peel's own party, but the prevailing opinion of Great Britain. For having supported the grant, Macaulay, otherwise a most popular candidate, lost his seat at Edinburgh in the general election of 1847. Up to 1847 English Roman Catholic schools were refused a share in the education grant. In that year the injustice was removed, not without violent opposition from Lord Ashley and the Wesleyans, at the motion of Sir William Molesworth,[2] a Benthamite, who probably had no religious belief — a suspicion also attaching to Macaulay.

Thus once more, as in the previous decade, we find theological prejudices opposing a barrier to educational progress which the most disinterested benevolence could not overcome, which had to be met by a radical change in the intellectual con-

victions of the people. After studying the English political and social revolution, we must now return to trace the course of that scientific, philosophical, and critical movement whose still unexhausted impulses are continuing to bear us forward towards new horizons at the present day.

## CHAPTER IX.

# THE MASTER-BUILDERS

DURING the earlier part of the nineteenth century a strong interest in Bacon's philosophy may be observed among the young Liberals of the period. It led them to conceive the discoveries and inventions of their own age as part of a general movement in which political reform represented no more than a single line of advance. But it soon appeared that the great Chancellor's work had all to be done over again. Sir John Herschel's *Discourse on the Study of Natural Philosophy,* published in 1830, showed, by its analysis of the experimental methods, what Bacon, not being himself an expert, could not know—that is, how scientific discoveries are actually made. It was followed, in 1837, by Whewell's *History of the Inductive Sciences,* a work which, although imperfect and in some parts retrograde, had the merit of suggesting still more forcibly the idea of science as one vast and connected body of doctrine. J. S. Mill acknowledges that, without the facts brought together by Whewell, his own *Logic* would not have been written.

Besides these products of native thought, a potent foreign influence, acting in the same direction, suddenly came into play. The earlier volumes of Auguste Comte's *Philosophie Positive* were appearing in Paris at this time, and speedily attracted the notice of some influential British

thinkers. Comte taught that the earliest social institutions were founded on theological conceptions of nature, on the belief that all phenomena are the product of personal volitions. Personal government and militarism go together with such views. Next comes a metaphysical or transitional period, in which abstract entities take the place of gods or of God as the explanation of whatever happens to us or about us. Finally, with the discovery that phenomena result from the invariable properties of matter acting by fixed laws of co-existence and succession, begins the positive or scientific stage of human progress, the maturity and perfection of society. Theologies, monarchies, and militarism, already undermined by metaphysical criticism, are destined to disappear in that ultimate stage, being replaced by a systematic intelligence of the world, founded on observation and reasoning, enabling us to foresee and provide for the future, and accompanied by a peaceful reorganisation of society on an industrial basis. The object of Comte's Positive Philosophy is to replace the dogmatic summaries of mediæval Catholicism and the abstract metaphysical systems of a later day by a conspectus of the fundamental sciences arranged in their logical order, with a general account of their methods, principles, and laws. At the summit of the series is placed the new science of sociology, which Comte claims as his own special creation. In a masterly survey of universal history he traces the development of society through the growth and decline of theology and war up to the dawn of an age when science and industry shall reign supreme.

Mill had been prepared to accept Comte's philosophy in so far as it agreed with what was permanent in eighteenth-century rationalism and what was progressive in nineteenth-century historical romanticism, by a study of the great Scottish thinkers, and by a similar though less complete training in modern science. He had long been preparing a systematic work on logic; it was completed almost simultaneously with the appearance of Comte's last volume, and incorporated some of the Frenchman's views, with qualifications rendering them less offensive to English prejudices. Mill accepts the law of the Three Stages, but tries to show that the belief in a fixed order of nature is quite compatible with the belief in a personal Creator, although in private he made no secret of not sharing that belief himself. In another way, however, Mill's *System of Logic* is more hostile to theology even than Comte's Positivism. Comte is so occupied with laws that he seems to overlook their true relation to causes. How phenomena are produced, he tells us, is beyond the power of man to know. All we know or need know is the order of their appearance. But no dogmatic pronouncements of the kind can prevent people from speculating on the subject; and the most effectual way to satisfy their curiosity is to show, as Mill shows, by an analysis of the idea itself, that causation means no more than unconditional antecedence. If something happens, something else will happen, and so on for ever. In order that something may happen, something else must have happened immediately before it, and so back for ever. What we say of any one event

may be said with as good reason of any other event as a happening, and therefore of the whole world conceived as a vast process of change. Mill calls this the "Law of Universal Causation." He expresses it by saying: "The state of the whole universe at any instant we believe to be the consequence of its state at the previous instant, insomuch that one who knew all the agents which exist at the present moment, their collocation in space, and all their properties—in other words, the laws of their agency—could predict the whole subsequent history of the universe."[1] This belief alone makes scientific induction possible; and when we talk about a reign of law, no more and no less than the reign of universal causation is implied.

Mill's philosophy goes beyond Comte's Positivism, and first gives it a solid foundation. No volitions, human or divine, interrupt the universal orderly sequence: volitions enter into it at most as links in an unbroken chain of causation. Nor is there any need to assume a First Cause for the world as a whole. For the law applies only to change, to what demonstrably has a beginning, not to the totality of things in which changes occur.[2]

According to Mill, we know this great truth, like every other truth, by experience alone—by having observed in numberless cases that every change has been preceded by another change, that in the same circumstances the same antecedent is followed by the same consequent, that no change

[1] *Logic,* bk. iii., chap. v., section 8.

[2] This is first brought out in the essay on *Theism,* published after Mill's death; but it can be read between the lines of the *Logic.*

has ever been shown to occur without an antecedent. Even the laws of arithmetic and geometry have no other proof than the evidence of unbroken experience in their favour.

While philosophers were setting forth the first principles of science in terms of such comprehensive generality, science was working up from the detailed investigation of particular phenomena, by the methods of experiment and reasoning, to generalisations almost as wide in their scope. Beginning in 1815, Michael Faraday, the greatest experimentalist of that or any age, had carried on a long series of researches, in the course of which he rediscovered what was already known on the Continent—that magnetism may be produced by electricity; and discovered for the first time that electricity may be produced from magnetism, both electricity and magnetism from mechanical motion, and mechanical motion from both, the resulting amounts of energy being always proportioned to the amounts expended elsewhere. He also succeeded in correlating magnetism with light, which had long been known as a product of electricity and of chemical affinity.

It is from this correlation of the physical forces, first completely established by Faraday, that our whole system of electric lighting and electro-motor machinery, destined ultimately to purify the air from smoke, has taken rise. Its consequences in the world of thought have been even more momentous. From the idea of correlation was deduced the still higher idea of conservation, the principle that the quantity of energy in existence

always remains constant, none being ever created or destroyed. This truth, first enunciated by Mohr, a German savant, in 1837, was rediscovered by Grove five years later, and made the subject of lectures delivered before the London Institution in 1842–43, but not published as a book until 1846. At the same time another English physicist, Joule, was ascertaining, by exact experimental measurement, the mechanical equivalent of heat.

Mill himself always remained rather sceptical about the philosophical value of these researches. But for younger thinkers they had the supreme importance of giving scientific precision to his own, or rather Laplace's, law of universal causation. It must be noticed in this connection that the idea of conservation did not become the common property even of the most highly educated classes until about 1858.

Assuming universal causation to be true, organic evolution follows from it as a necessary consequence. Geology shows that there was a time when the present species of plants and animals did not exist. They must therefore have originated either directly from their inorganic elements, or by a process of gradual variation from pre-existing species. All experience goes against spontaneous generation, all experience testifies to gradual variation; therefore the second alternative is adopted. We saw how, before the end of the eighteenth century, Erasmus Darwin enunciated the doctrine of evolution; but its first systematic exposition in the English language did not appear till 1844. This was a book called *Vestiges of the*

*Natural History of Creation,* by Robert Chambers, an Edinburgh bookseller. Chambers was not a scientific expert, nor altogether an original thinker, but he had studied scientific literature to better purpose than any professor, and he brought together a mass of evidence going to show that the solar system, the earth's crust, the organic world, and human civilisation had been gradually developed under the action of natural forces.

Throughout, the author's attitude towards religion is most conciliatory. Development is exhibited as another proof of design, and therefore as a fresh argument in favour of theism—the very position occupied by Bishop Temple forty years later, and now accepted by most theologians. It is also "reconciled" with Scripture, with no worse, if with no better, success than geology had been "reconciled" before it. Nevertheless, the *Vestiges* raised a storm, and probably would have ruined the bookselling business of the Chambers brothers if Robert's connection with it had not been kept a close secret. People had not yet been taught that evolution leaves Christianity stronger than ever; they thought that to admit man's development from a lower animal would seriously shake the assurance of his possessing an immortal soul; nor did they relish the prospect of his being superseded in the lordship of earth by some higher animal—or what a German plagiarist of English ideas has since called the superman. Modern science has added fresh arguments for evolution to those employed by Chambers; but the considerations that now recommend it to popular audiences are no other than those urged in the *Vestiges.* If in

two generations they have come to exercise a more persuasive influence, this is not least because the resisting power of theology has been weakened by internal decay.

English literature has often presented under an imaginative form the criticism of what is mischievous or rotten in real life, and the endeavour to replace it by nobler constructions of an ideal type. Perhaps for this reason great reforming periods seem less favourable to great literature than periods of reaction or stagnation. We have seen how literature bloomed in the dismal epochs of 1799 and 1817, and how it declined under Canning and Brougham; we have now to glance at its rebirth in the magnificent early Victorian period, when Melbourne's policy was to let things alone, when Peel's policy was to delay reforms until they commended themselves to the agricultural mind. All the great writers of that age were more or less hostile to such quiescence, to such procrastination; all were animated by a discontent more or less divine. We know some of them best in their later days, tamed by wealth and honour, thankful to rest themselves and a little impatient with the restlessness of their juniors. We look on Macaulay as a placid Whig, on Carlyle as a foe to modern Liberalism. But Macaulay was to some extent a Radical, and in India a great reformer; Carlyle was ready with "plenty of Radicalism," though not quite of Mill's sort, if Mill had made him editor of the *London Review*. We remember Tennyson as a timid Conservative, and Browning as a fantastic antiquarian. But the young Tennyson

gloried in change and novelty as such; all his hopes were for a future that should not be like the past. He bids the bells—

> Ring out the old, ring in the new,
> Ring out the false, ring in the true;

his heart is with the workers who are "ever reaping something new"; he goes with advancing science, and looks forward to an age of universal peace. To the same effect, but with more swing and power, Browning exclaims:—

> 'Tis time
> New hopes should animate the world, new light
> Should dawn from new revealings on a race
> Weighed down so long, forgotten so long.

For Browning also, like Burns and Keats, beneficent action rather than poetry was the ideal. Genius, he tells us in *Sordello*, is given to make mankind act, not to amuse them by seeing its possessor act each of them.[1] Carlyle had the same passion for work in preference to words, and could no more satisfy it than Browning. It turned with him to a glorification of great rulers; with Browning it vanished before a philosophy that glorified love as the only good in the world.

If Carlyle ever had hopes of an office under government, they must have perished with the advent of Sir Robert Peel to power. He replied to the Conservative reaction by editing the *Letters and Speeches of Oliver Cromwell,* practically a vindication of England's greatest ruler against both Whigs and Tories, and at the same time a vindication of Puritanism against the Oxford Movement. Lord Melbourne's fall may be thanked on stronger

grounds for two other monumental contributions to historical Liberalism. Grote was left free by his retirement from Parliament to go on with his History of Greece; and Macaulay was left free by the loss of office to go on with his History of England. Grote's work has been called a pamphlet in twelve volumes in defence of Athenian democracy. Macaulay's History never developed the full proportions contemplated by its author, but the fragment he achieved told, so far as it went, against the Legitimist absolutism brought into fashion by the Tractarian and Romantic currents combined.

While science, philosophy, poetry, and history combined were thus liberalising English thought through and through, prose fiction was contributing its share to the transformation of English social ideals. Dickens and Thackeray are the greatest novelists of the early Victorian period. Now it has been observed that Dickens "spent his early manhood among the politicians trained in Bentham's school," and that he "hardly ever wrote a novel without attacking an abuse"; while Thackeray's "opinions have a strong resemblance to those to which Rousseau gave popularity."[1] Indeed, Thackeray goes farther than Rousseau in pouring contempt on the rich and great, and in denouncing the adulation given to high rank by the English middle classes. Intensely modern and *bourgeois* in his view of life, and a warm admirer of American society, he has nothing but scornful mockery for the pietistic and patriarchal feudalism of Young

England. Then comes Charlotte Brontë's *Jane Eyre*, with its glorification of passion as a leveller of social distinctions, followed by *Villette,* with its merciless picture of Jesuit morality put in action under the most favourable conditions. From a literary point of view, both works have set before all subsequent novelists the model of a style unequalled for its combination of splendour and strength.

This gospel of pure passionate love, as against conventionality, mammon-worship, selfish ambition, sybaritism, and profligacy, found another exponent in Emily Brontë, notwithstanding the haughty stoicism of her personal character. It is, as I have said, the very essence of Browning's philosophy, and was signally realised by his marriage with a great poetess. Before meeting him, Elizabeth Barrett had been led by a false religion to believe that her father's frightful selfishness was heaven's just judgment on her for giving to an earthly object affections that God alone could rightfully claim.[1] She learned to think very differently in Italy; and the last Book of *Aurora Leigh* gives an expression of supreme eloquence to what her husband had taught before in *Colombe's Birthday* and *The Flight of the Duchess.* Tennyson, too, whose own love-match had been delayed by poverty, strikes the same note in the Poems of his second period; and his *Princess,* on the surface a manifesto against the higher education of women, seems to have been inspired by a dread that it might interfere with the rights of passion, by separating them from their

[1] See the splendid poem entitled *Confessions.*

natural companions, whereas it has resulted in a closer intimacy between the sexes than before.

The glorification of human energy on the part of historians whose dissent from the dominant religion, although complete, remained unspoken, and of human love on the part of poets who gave Christianity an ostensible support, shows how far English idealism had become estranged from the pietism of twenty years before, and how utterly the Oxford Movement had failed to recapture it for ascetic superstition. At Oxford itself a counter-movement in the direction of free inquiry had sprung up even before Newman's secession to Rome in 1845; and the younger men, of whom some had been trained by Dr. Arnold, were rapidly assimilating the results of modern German thought. Strauss's *Life of Jesus,* published in 1835, soon became known in England. A brilliant and short-lived journalist, who was also at one time a clergyman, John Sterling, still remembered from his friendship with Carlyle, seems to have finally abandoned supernaturalism on reading it. Another young clergyman who had been a disciple of Newman's, the future historian, J. A. Froude, learned from Strauss to think of all religious traditions as myths. In 1849 he published a novel called *The Nemesis of Faith,* so outspoken that it led to the resignation of his fellowship at Exeter College. More than ten years earlier a little group of men and women at Coventry, belonging to the industrial classes and brought up in the narrowest pietism, had, without any help from Germany, come to reject the Gospels as miraculous narratives.

One of them, destined hereafter to achieve a world-wide fame under the name of George Eliot, undertook to translate Strauss, and produced a masterly version of his epoch-making work in 1846.

But the writer who made the deepest mark on the rationalistic side was F. W. Newman, a younger brother of the Tractarian leader. After taking the highest honours at Oxford he had gone out to Syria as a missionary. This calling entailed on the ardent zealot a close study of the New Testament. It led him first to doubt the legitimacy of the dogmas based on Scripture, then the trustworthiness of the Scriptural record itself, then the truth and even the excellence of Christianity as a religion. His *Phases of Faith* (1850) is a detailed and sincere account of the reasonings that led him step by step to this long unwelcome conclusion.

Some months after the appearance of *Phases of Faith* W. R. Greg, a Unitarian business man and journalist of high character and intellect, brought out a work of equally destructive and more systematic character called *The Creed of Christendom,* but really directed against the Bible's claim to supernatural authority. Although a remarkably luminous summary of the arguments on that side, it did not attain any wide popularity until nearly a quarter of a century later.

In those times it was considered a great victory for Freethought that the publication of such works as Newman's and Greg's did not entail unpleasant consequences on their authors. Ten years earlier, according to Sir Charles Lyell, they would have been sent to Coventry for it. Such, indeed, had

been the fate of Froude, who was cut by one friend after another in the streets of Oxford. So late as 1842 a few impulsive words uttered at a public meeting brought a worse penalty than social ostracism on the speaker. This was the celebrated G. J. Holyoake. Lecturing on Home Colonisation at Cheltenham the year before, he had been taxed by one of the audience with leaving God out of his scheme. Holyoake replied that he did not believe in God, and that he would put the Deity on half-pay, meaning that he would like to see half the property of the Church devoted to the relief of the poor. He was tried at Gloucester Assizes for blasphemy, and condemned to six months' imprisonment. After being liberated he found means to open a bookseller's shop in London, and became the founder of Secularism. This he has defined as the moral duty of man deduced from considerations pertaining to this life alone. In the neater phrase of a disciple, "Secularism purports to regulate human affairs by considerations purely human."[1] At its first promulgation Secularism was understood by friends and foes alike to exclude all theological belief, whether Christian or simply theistic. Secularists need not be atheists, but they could hardly be more than Agnostics. Since then a tendency has gained ground among professing Christians to identify the divine with what is most characteristically human—*i.e.*, with man's higher faculties; and a philosophical theologian has gone the length of proclaiming the service of humanity as the true and only service of God.[2] But when

[1] G. W. Foote, in *Religious Systems of the World*, p. 526 (1st ed).
[2] Edward Caird, *The Evolution of Religion*, vol. ii., p. 320.

Holyoake began his Secularist propaganda such an identification had not become popular, and for many years he carried on an active campaign against the current beliefs, culminating in his *Trial of Theism* (1858), one of the ablest books ever directed against the belief in a personal God.

As a disciple of Robert Owen, Holyoake interested himself warmly in the cause of industrial co-operation; but he understood better than Owen the importance of bringing this and all other movements for the elevation of the people into line with the democratic agitation. He also adopted more openly than Owen the Malthusian principle that the prosperity of the working classes can only be secured by restraining the increase of their numbers.

The same doctrine is advocated with something like enthusiasm in Mill's *Principles of Political Economy* (1848), long accepted as an authoritative manual of the subject. Mill agreed with Malthus in regarding over-population, while it lasted, as an impassable obstacle to Socialism; but he believed that legislation directed towards raising the standard of comfort and spreading knowledge among the working classes might induce them to set a voluntary limit on the number of their children. He also spoke hopefully of the co-operative movement, although he did not think that it would ever succeed, by means of peaceful competition, in beating capitalistic production out of the field. So far his anticipations have been justified. Co-operative societies for consumption have thriven and multiplied; co-operative societies for production have on the whole failed, and the most successful have departed from their original principle by becoming

mere joint-stock companies employing labourers paid by fixed wages. Hence in collectivist circles the voluntary Socialism of Owen and his followers has been succeeded by a revival of Chartist State Socialism, advocating the expropriation of land-owners, mine-owners, and capitalists by local municipalities or by the government of the whole country.

Chartism itself came to an end as an organised movement in 1848, the great year of abortive revolutions. Some of its leaders had seriously discredited their cause by acting against the Free Traders and breaking up Anti-Corn-Law meetings. Free Trade, however, had not wrought miracles. Vast quantities of capital had been sunk in railway speculation ; this, combined with the potato-famine, produced a commercial crisis, the effect of which was widespread distress among the people. Then Chartism lifted its head once more. A petition demanding the famous Six Points received an immense number of genuine and not a few spurious signatures. Preparations were made to carry it to the House of Commons, followed by half a million persons. Government forbade the procession ; Wellington took effectual means to resist its approach by armed force ; volunteer constables contributed overwhelming numbers to the defence of order. Finally, the petition was carried to the House in a cab, referred to a Special Committee, and shown to bear only a third of the signatures boasted of by the leader of the demonstration, Feargus O'Connor.

A group of liberal clergymen and laymen, with the Rev. F. D. Maurice at their head, profoundly

touched by the prevalent distress, proposed as a remedy to substitute theological for secularist principles in an attempted reorganisation of the most insufficiently remunerated industries, and started a new scheme of co-operation under the title of Christian Socialism. But religious inspiration failed to do the work expected of it, and, after a brief struggle for existence, this well-meant effort towards a practical evangelisation of the masses collapsed.

A writer of surpassing genius who, towards the close of the century, did more than any other single individual to revive the cause of Socialism, first made his mark during this period. Born in 1817, John Ruskin received first a clerical, then an artistic training. Opinions differ as to whether he might have become a great painter; he certainly became a great master of pictorial language. Although by nature and education an egoist, for many years he devoted all his powers to the interpretation of Turner's art, finding in it a deep philosophic meaning of which the great landscape painter had never dreamed. Turner was in fact a romanticist in form and colour, who habitually reconstructed the visible aspects of nature in such a way as to make them yield imaginative and emotional effects comparable to those produced by the most energetic discharges of passion, or by the most impressive groupings of ideal experiences in the works of his great poetic contemporaries. Ruskin professed to regard the painter's wonderful creations as primarily a new revelation of natural truth, and therefore he prepared himself for his work as an art-critic and
